

Vivo X90 Pro

If Zeiss ever made a phone, this would be it

Vivo X90 Pro is one of the first MediaTek Dimensity 9200-powered smartphones.

It comes with supreme camera chops, a vibrant display, and a design that gives the smartphone its own distinct camera-like look and feel. We tested the Vivo X90 Pro and here is what we found out –

DESIGN

Starting with the design, the Vivo X90 Pro looks like a camera-centric device from the moment you set eyes on the phone. The leather-finish back panel is divided into two parts with a chrome strip running from right below the camera eye, as Vivo calls it. Overall, the Vivo X90 Pro looks and feels super premium. The leather finish back panel, the metal frames, the curved display, everything is top quality. The only thing I didn't like about the design, is that the camera module or the camera "eye" as Vivo calls it, protrudes too much from the back panel.

DISPLAY

The display quality on the Vivo X90 Pro felt kind of dull as compared to other flagships. The colours on the display are pretty accurate, but they don't seem as vibrant as on some competing devices. On the X90 Pro, we get a "Zeiss Natural Colour" colour profile, which is calibrated by Zeiss. This colour profile gives the X90 Pro's display a true-to-life colour profile, which is slightly warmer than Vivo's preset "natural" colour profile. Coming to responsiveness and brightness, this display is good. The experience was nothing short of slick and responsive. We tested the brightness using a Lux Meter, and the X90 Pro showed a maximum brightness of 831 nits. The minimum luminance achieved was about 8 nits. While the numbers aren't all that

bad, there were times when I struggled with the outdoor visibility of the X90 Pro, especially when there are a lot of reflections.

PERFORMANCE

Starting with numbers, the Vivo X90 Pro showed an impressive score of 1,210,175,

which is one of the highest among all the flagship smartphones we have tested so far. On Geekbench, the Vivo X90 Pro has the highest-ever single-core score of 1,700, along with a multi-core score of 4,328. In other PC-based benchmarks also, while the smartphone didn't score the highest in all benchmarks, the numbers are similar to the Snapdragon 8 Gen 2-powered smartphones we have tested in 2023. However, the Dimensity 9200 was way ahead of competition in the single-core Geekbench test. In GPU-based tests, the X90 Pro again showed impressive numbers. Vivo X90 Pro felt everything a flagship should. It doesn't heat up as much as well, which is great!

CAMERA

The images out of the Vivo X90 Pro's camera look straight out of a professional camera. They are sharp, crisp, and extremely accurate in terms of depicting

colours and light. The detail retention in these photos, largely due to the 1-inch camera sensor, is also great. I pitted the X90 Pro against the Samsung Galaxy S23 Ultra in some images, and despite the Samsung's 200-megapixel sensor, the X90 Pro still had better detail retention in many scenarios. Coming to portraits, the edge detection is brilliant, and the f/1.75 aperture helps with the background blur, which can be adjusted to up to f/4.0 - that is a wide aperture range for users to play around with. Overall, this is one of the most comprehensive camera setups out there. The quality of images is brilliant in pretty much all lighting conditions. Low light, especially, is very good. At times, the device is able to click pictures even in pitch black environments, and the portraits look straight out of a mirrorless camera. There are a few issues, for example the Vivo X90 Pro also does a bit of a colour shift when focusing on smaller subjects, and slight inconsistency between shots from the primary and wide angle shooters. But apart from that, Vivo has pretty much aced the camera game with the X90 Pro.

VERDICT

The X90 Pro's benchmark numbers are right up there with the competition, and the gaming experience on the Vivo X90 Pro was also pretty decent. On top of that, you can take stunning pictures pretty much every time you use this camera. Overall, everything is just plain good on the Vivo X90 Pro - from the camera to the build quality. It's just the FunTouch OS software that makes it difficult to recommend the Vivo X90 Pro over the likes of Samsung and Apple.
