

OPPO F23 5G

Party trick up its sleeve

T I tested Oppo's latest mid-ranger, the Oppo F23 5G here at Digit's test lab in Noida for a couple of weeks, and here is what I think about this smartphone:

DESIGN

The Oppo F23 5G has a polycarbonate back panel which doesn't feel very sturdy and the in-hand feel isn't very premium. The phone has flat edges, but the back panel curves around the edges. The display also doesn't merge into the frame as seamlessly as I would have liked, but that is a very minor design detail. Apart from this, the Oppo F23 5G is quite lightweight. Overall, the Oppo F23 5G's design is very basic.

DISPLAY

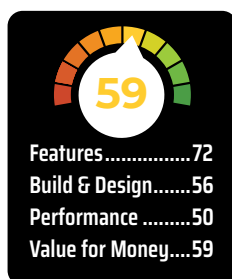

The display on the smartphone is just average. We get an IPS LCD display, and the colours seem a bit too saturated. While watching content on YouTube, I found the Oppo F23 5G's display to have a bit too many highlights, which is not too good. It also doesn't support HDR content on apps like YouTube and Netflix. In terms of responsiveness, however, this display is pretty good. It is also bright enough. We put the luminance to test using a Lux Meter, and the Oppo F23 5G showed a maximum luminance of 576 nits, and a minimum of 6 nits on a plain white screen.

PERFORMANCE

Coming to performance, we did test these numbers, and the benchmark scores are pretty average. On AnTuTu, the F23 5G scored 412,540 points, which is good for a smartphone overall, but not for a mid-range device. There are similar-priced products in the market that offer almost double the score.

₹24,999

In another CPU-based benchmark, the Oppo F23 5G lagged behind many rivals. Coming to GPU-based tests, here also the Oppo F23 5G didn't show anything impressive. In the 3D Mark Wildlife test, the Oppo F23 5G scored 1,211 points, which is way less than some of the other devices in this range were able to put out. The read and write speeds are similar to other smartphones that use UFS 2.2, but since this is an older storage standard, it falls behind the ones that use UFS 3.1 or above.

BATTERY

The battery backup on the Oppo F23 5G is great. For example, a 15-minute Call of Duty: Mobile session only drained 4 percent of the smartphone's battery and 30 minutes of watching videos on YouTube on the highest resolution and full brightness also drained only 4 percent of the battery.

CAMERA

The F23 5G's primary camera performs pretty well. The 64-megapixel sensor takes nice and sharp photos, and

even focuses on the subject nicely, in order to give it a nice depth effect. In challenging light, the images are a bit grainy and lack detail, but that is managed well by turning on the night mode, where the camera takes in light from the closest sources, in order to make for a vibrant image. We also get a 2-megapixel depth sensor for portraits. The portraits also aren't great. The smartphone smoothens the skins a bit too much, and the details are also not the best. Further, I found the colours to be a bit dull in portraits and the edge detection is also not the best we have seen. At times, the Oppo F23 5G messed up with detecting the edge. The front camera images are crisp, sharp and vibrant in terms of the colour profile.

VERDICT

So that was our review of the Oppo F23 5G. It is a pretty basic Android device, but comes with some interesting features like the microscope camera. We get a basic build with a polycarbonate back, a hole-punch display up front, and flat edges. The camera is also not all that great, and we get very basic performance, which is a sub-Rs 20,000 smartphones can easily put out.

Overall, it is not a smartphone that I can recommend for a ₹24,999 price tag since there are a lot of better options available in the same range. However, if you are not concerned about performance or camera, and want something that offers you a good party trick, then the Oppo F23 5G is a good option
