

NoiseFit Force Plus

Bold and basic, but should you buy?

G.S. Vasan | vasan@digit.in

NoiseFit Force Plus is a rugged smartwatch from Noise that looks sporty and as if it is built to withstand rough handling. If you have a modest budget but an adventurous spirit to engage in intense sports, the ₹3,999 price tag of NoiseFit Force Plus might draw your attention. However is it worth your hard-earned money, let's find that out here. I have worn it for a week and here is my experience with it.

Design

The main pitch is its rugged and/or sporty appearance. The case has uneven surfaces that give this look and perhaps even some endurance against long-term wear and tear. There are no certifications backing this, except for the IP67 rating against dust and water.

The chassis is made of polycarbonate and zinc alloy combination. The build results in the thing weighing 64 grams. That's not too heavy but bulky enough to stay off of my wrist during night hours. Also, its shiny "Mist Grey" colour isn't something I would like to wear during day time even. The Teal Blue colour is also like whatever. But, the black one appeals to my eyes. Your taste may vary.

There are two buttons on the right, the uses of which we will get to in a later section, but for now, know they click slightly differently. Not sure if it is just with my unit, but the top button is more relaxed whilst the bottom one has some resistance. It's less clicky.

Attached to the case is a 22mm rubbery strap. You can swap it if you want to try a replacement strap from gonoise.com.

Display and UI

Coming to the front of the watch again, here within the circular walls lies a 1.46-inch AMOLED panel with 466x466 pixel resolution. It is sufficiently bright and legible, even outdoors.

You get more than 100 watch faces to customize the dial. The default ones were gaudy in my opinion and so I was quick to change them.

You can sail through the watch's interface using swipes and taps. Swiping left to right or vice versa shows the various widgets. The UI is too smooth to use. Swiping downwards brings the notification tray. The notifications land on the watch very quickly. You can tap on a notification to expand the message view and read the entire thing. However, you can't reply or react to them.

Swiping upwards brings the quick toggles and one of them is the settings option. Within the settings, there is an option to enable both Wrist Awake (raise your wrist to activate the screen) and Tap To Wake Up (tap on the screen to turn it on). But to save some battery life, you can disable them and click the top button to light up the display. When you want to put the screen to sleep, you can keep your palm over the dial and the lights turn off. The top MFB (Multi-functioning button) can be clicked to enter the main menu and also to go back to previous screens and finally reach the home screen. The bottom one, however, is just there to open up the workout menu. I don't mind its single utility as one would want a shortcut to this list for frequent quick access.

Let's see how it fared during my workout sessions.

Performance

NoiseFit Force Plus bags a heart rate tracker, SpO2 monitor, stress measuring option, female period tracker, sleep monitor, and the ability to count steps, distance, and calories burned. You get to record 130+ sports
