

activities also. On my route to the gym (which is about 750 meters), the NoiseFit watch showed 720 meters or 0.72 km.

I then had a small 3-minute session on an indoor bicycle which resulted in a 15 kcal burn and an average heart rate of 120 bpm. Both these stats were close to what I was getting on an Apple Watch Series 8 I had on my other wrist (for the purposes of benchmarking). By the way, the blood oxygen count was matching

between the two watches. Next, as part of the drill, I had about an hour of weight training which cost me 529 kcal on the Apple Watch and 235 kcal from Force Plus. This is a major deviation and seemingly wrong stats from the Noise watch. The average heart rate also was off by a margin.

So, accuracy isn't something to expect from it. There is however some consistency in the stats. Be it distance tracking or the calories burned, the numbers are comparable

to a previous day's count. The day ends and as I went to bed at night, I put it on as well as the Apple Watch on different wrists. In the morning the sleep hours came out similar on both. So, it does that job well. Now a feature, not health related, but much sought-after from a budget smartwatch is Bluetooth Calling. You get Tru Sync (single chip for calling and the general Bluetooth connectivity) technology, facility to save up to 10 contacts on the watch itself and even a dial pad to ring from the wrist. The call quality was fine.

Finally, battery life. The advertised runtime is 7 days with typical usage. On standby, it claims to run for 30 days. To refill it, you are getting a proprietary charger with magnetic pogo-pin based clasp. It takes about 2 hours to full charge the thing from zero to hundred. Let's now see how it does its job overall.

What do I think of it?

In the intro, I wrote NoiseFit Force Plus is a "rugged-looking" smartwatch. It is not rugged like the more expensive options. But for a price of ₹3999 (after discounts), the watch's design is likely to offer some shock resistance. The brand doesn't make any lofty claims either.

So, while getting into the test, my motive was to see if it is a good smartwatch, keeping its build aside. After all, it's what's inside that counts. In that respect, NoiseFit Force Plus is a serviceable offering from the brand, for the most part.

Save for some inconsistency in the calorie data, the health and fitness tracking performance was good. And so, if you want a decently performing smartwatch with bold looks and don't want to spend more than ₹4K, you can check out this Noise smartwatch at gonoise.com and Flipkart. It makes for a decent purchase if you are looking to get your first smartwatch and are conscious about its looks and the bells and whistles it comes packing with. **d**
