

Ambrane Wise Eon Max

Does it make for a convincing option?

G.S. Vasan | vasan@digit.in

In an ever-growing and crowded smartwatch market like ours, it can be a time-consuming task to find a smart timepiece that checks all your needs without costing a lot. At ₹2,799, Ambrane Wise Eon Max comes poised to be one. Ambrane has been in the wearable space for a minute now but this has been my first time wearing its smartwatch. I have used the Ambrane watch for a week and here is my experience.

Design and Display

Ambrane Wise Eon Max has a squircle display that stretches 2.01 inches. The bezels on the top and the two sides are negligible. The bottom one is comparatively thicker. The screen is colourful, bright and smooth at 240x283 resolution, 550 nits of luminance, and 60 Hz of

refresh rate. Although you get 100+ watch faces to choose from, they are hardly unique or attractive.

The chassis is of polished nickel colour and the connected silicone bands are of brown chocolate colour. The watch feels decently built and looks okay on the wrist. The Ambrane

branding is present subtly on the strap, at the base of the watch and on the face of the crown.

Ambrane has also equipped the watch with IP68 dust and water resistance. So, design and build-wise, it's a fine smartwatch. However, the interface inside and the software within the app are very basic.

Software

Swipe up from the bottom of the main screen to get to the menu of all apps. It's a list with coloured icons for each app or feature. But it looks dull, probably because of the dark grey background. If you want to, you can change the menu mode to a honeycomb style, but that in my opinion makes finding an app much more difficult.

Now, in case like me you also mistake of pressing the crown opens the menu, but it doesn't. Pressing it takes you back to the previous screen and finally to the home screen. When you are on the home screen and you tap the crown, it turns off the display. Clicking it again turns on the screen. Swiping right from the left edge of the screen shows a sidebar with your favourite apps, weather, time, date, and day. I don't find the relevance of the time shown here. Anyways, swiping left shows the widgets like games, AI assistant, voice assistant, beats per minute, blood oxygen, sleep, music controls, etc. Swiping downwards from the home

screen shows the quick controls.

I don't think there is a notification tray where one can find all the notifications from the phone. The notifications do appear on the watch in real time. There isn't just a place where one can find older/missed out notifications. I think the company should have mapped
