

the crown or one of the swipes to open a notification tray. Even the app is very barebones or you may find it straightforward and good enough. It is called Da Fit which again sounds uninspiring. I think Ambrane should come up with an app named Ambrane “something”.

Performance and Power

Like most recent smartwatch releases in India, this one also comes with Bluetooth calling capability thanks to a built-in microphone, speaker, and dialer. The call quality is passable as long as you are not so far from the phone. Coming to the actual tracking performance, there have been one or two instances wherein the watch wasn't triggering the sensors (in the case of the SpO2 tracker, I believe) and instead, it asked me to fasten it tightly. I exited and rerun the app which activated the sensors.

When it worked, the stats were close but did not exactly match the Apple Watch Series 8 which I was wearing alongside for test purposes. In a 34-minute workout, a difference of 8 KCAL in calorie count and 12 BPM in heart rate count. When I tried manually running the heart rate and SpO2 tracker, the Wise Eon Max was throwing similar results as the Apple Watch. This impressed me! The same can't be said about sleep tracking though. The sleep duration was more on the Ambrane watch by 37 minutes. So, tracking-wise some

things are commendable while not quite much in other cases. Overall, the watch should still be usable for a general idea of your activity level and fitness progress. Using the watch for days at large shouldn't be a problem either as the battery life is also long. The brand claims up to 10 days and I think the Wise Eon Max could keep its word. The bundled pogo-pin charger takes about 2 hours to fill the battery from 0 to 100. Well, that's a quick run through my experience and here's what I finally think.

What do I think of it?

Ambrane has packed a reasonable working fitness tracker in a basic-

looking watch. This could easily get lost in a crowd of smartwatches from more established brands. Therefore, if Ambrane wants to stand out from the crowd, it needs to push the envelope, or the very least offer something so appealing in the design of both the hardware and software of its wearables. That said, for the average person who just wants a smartwatch for the sub-₹3k price tag that gets the basics fairly right, this one's very well worth considering. This watch can be your gateway into the world of smartwatches. It's light on the pocket and the wrist and comes with the bells and whistles that you'd expect. **d**
