

Dell G16

Gaming laptop gunning to replace your gaming PC

Yetnesh Dubey | yetnesh@digit.in

The Dell G16 7630 is a desktop replacement and you can't convince me otherwise. And after testing the laptop thoroughly I am convinced that it is easily just that. But a hefty price tag and some 'interesting' choices taken by Dell do try very hard to take the value out of an otherwise very well-built, high-end gaming laptop, that's also a desktop replacement. Yes, it is, and you can't convince me otherwise.

Before I begin, here's a small refresher about the Dell 'G' series gaming laptops. In terms of pricing, the Dell 'G' series sits below the Alienware gaming laptops but the former does take some of the best bits of the latter.

For starters, the Dell 'G' series gaming laptops easily resemble the design and build quality of its much pricier cousin. And another thing which these laptops does really well is to offer a good thermal and graphics performance. The latter is due to the fact that Dell employs high TGP GPUs on its gaming laptops. But nothing is perfect and in the past, the Dell 'G' series gaming laptops have also suffered from a low-quality 250 nits display.

Today we're taking a look at the Dell G16 7630, a 16-inch 'G' series gaming laptop. So the great build quality, high TGP GPU and great thermal performance are some things which I am naturally expecting from this device. Moreover, considering its price tag, I

am also expecting an overall excellent machine in all the other areas as well.

Build Quality, Keyboard And Trackpad

The Dell G16 7630 is big. Diagonally measuring a bit more than 16 inches, the latest G16 weighs close to 2.8kg. But that's not all its 330W charging brick weighs close to 1.2kg on its own. So do not consider this laptop as something you can carry around your back all day. In addition to being big, it is also quite thick. At around 25.65mm thick, the G15 is as thick as a Samsung Galaxy Book3 Pro 360 and a Lenovo YOGA Slim 7i combined. And although it goes without saying, being a 16-inch gaming laptop, the Dell G16 7630 won't fit in the normal-sized office backpacks which are primarily designed for a 15.6-inch laptop. Now that you know how big the device is, let me tell you how it's built. The answer is like a tank. More specifically, like a tank made out of hard plastic. The quality you get here is in terms of fit and not so much in terms of finish. The laptop's hinge feels very solid and stays in its position doesn't matter where you put it.

The laptop's deck is quite huge and it employs a 60 per cent keyboard. Its keys have a good spring action and
