

Lenovo Yoga 9i

When we tested the Lenovo Yoga 9i last year, we crowned it 2022's best 2-in-1. Early this year we saw the new Lenovo Yoga 9i, featuring the new 13th gen Intel

processor. The rest of the hardware has for the most part remained the same. You get a fantastic 4K or 2.8K OLED multi-touch display with 100% sRGB and DCI-P3 coverage, making this a great laptop for content creation on the go. You also get 16 GB of LPDDR5 RAM clocked at 5600 Mhz, and 1 TB of NVMe SSD storage. The 13th gen i7-1360P provides faster performance overall, but does fall short of last year's i7-1280P when it comes to multi-thread performance, due the 13th gen processor having fewer cores. However, like we mentioned, the 13th gen processor still nets an overall improvement in performance over the already fantastic 12th gen processor. So if you're looking for premium thin and light with a fantastic display and great performance paired with portability, you can't go wrong with the Lenovo Yoga 9i either.

Apple MacBook Pro 14 2023 M2 Pro

The MacBook Pro 14 2023 with the M2 Pro is one of Apple's most powerful offerings in the market, and comes with a

price tag to match. There is a pretty massive leap in performance over last year's MacBook Pro 14, with estimates averaging an overall improvement of 20-25% across the board. That's pretty huge, considering how powerful the MacBrook Pro already was. The M2 SoCs are really pulling their weight it would seem. Other than a straight up improvement in performance, the MacBook Pro 14 also promises good battery life, while keeping thermals in check. The laptop is not known to be loud at all, and will breeze through everyday tasks with ease. The laptop features a bright 14-inch display with accurate colours, making this one of the best creator laptops you can pick up in the market. If that wasn't enough, you can get up to 96 GB of RAM and 8 TB of SSD storage, which will take care of pretty much any and all of your storage and

memory needs. Of course, that's also going to cost you a bomb, and possibly a leg, a kidney, a lung, and more.

Dell XPS 13 Plus

When you think of a premium thin and light laptop, the Dell XPS 13 is a laptop that's guaranteed to pop up. The Dell XPS 13 Plus is the latest from Dell which fea-

tures a 12th gen Intel Core i7-1260P processor with 12 cores and 16 threads. This is a powerful processor which offers great performance. The Dell XPS 13 Plus also features a new design, while the exterior maintains the same look as its predecessor, the XPS 13 Plus features a new keyboard which we really liked, and a new floating touchbar. The laptop still maintains top-notch build quality. The XPS 13 Plus comes with a bright and crisp OLED display, with a UHD+ resolution (that's 3840x2400) and near 100% sRGB and DCI-P3 coverage, making it great for all your content creation needs. We did find the Dell XPS 13 Plus to be a bit lacking when it came I/O port offerings; there are only two type-C ports. Both of them are Thunderbolt ports which are fairly versatile, but we definitely felt the lack of ports.

Acer Swift X

Most of the laptops on the list so far have been extremely premium thin and light or creator laptops. Meaning they're all also incredibly expensive. However,

we've got an option for those of you who are looking for a budget laptop as well. This is the Acer Swift X, a thin and light laptop which features an 11th gen Intel Core i7-11390H. This is a quad-core processor with a max clock speed of 5 GHz, which is pretty fast. But the lack of cores means it will struggle with intensive tasks like rendering. However, the Acer Swift X also comes with an NVIDIA RTX 3050 Ti to help with those tasks. This, paired with 16 GB of LPDDR4 SDRAM, 1 TB of NVMe Storage, and a FHD display with an advertised brightness of 300 nits and 100% sRGB coverage, make this an appealing laptop for students. Or anyone looking for an entry level or budget creator laptop. **d**
