**C**ameras are one of the most important factors when it comes to making smartphone buying decisions. Often, the best smartphones offer good cameras and good camera phones end up being one of the best smartphones available to buy. However, the two aren't always mutually exclusive. As things stand, there are a number of interesting devices in this category that can take the crown of the best camera phone in the market. In this list, we'll list the best camera phones that money can buy right now. These devices include the best of the best, including the iPhone 14 Pro Max, the Galaxy S23 Ultra, Vivo X90 Pro and the OnePlus 11. So make your choice wisely.

## Apple iPhone 14 Pro Max

Apple's been making great camera phones for years now, so it's no surprise that the iPhone 14 Pro Max finds place on our list. In fact, because Apple has managed to bring in substantial upgrades in the camera department with this device,

the iPhone 14 Pro Max manages to make it to the top of the list this year. This is in part because with the iPhone 14 Pro Max, the phone maker finally ditched the 12-megapixel primary lens that it has been using since the iPhone 6s and upgraded it to a 48-megapixel one. This one offers a big f/1.78 aperture and sensor-shift optical image stabilisation among other features, that help it click well-detailed images in both good or low lightning conditions. This is also true for the 12-megapixel ultrawide and 12-megapixel telephoto lens on the iPhone 14 Pro Max, that also click shots that are rich and vibrant, and thanks to Apple's nous in the photography department, come out looking true to life with good dynamic range.

## Vivo X90 Pro

This new camera phone from Vivo has cameras that have been developed in collaboration with German photography giant, Zeiss. The X90 Pro uses Sony's 50MP IMX989 for all the heavy lifting. This huge 1-inch primary sensor, clicks natural

looking photos with very good depth-of-field effect with clear distinction between the blurred background and in-focus foreground. This allows the X90 Pro to click some seriously impressive point and shoot images, that look almost like they've been clicked using a DSLR camera. Thanks to the presence of optical stabilisation and a fast shutter, the X90 Pro

also manages to click a lot more usable shots than it clicks out of focus, blurry images. Thanks to the V2 imaging chip and the photography algorithms working in the background, the X90 Pro also clicks well detailed and vibrant shots even in low light scenarios. Apart from this, it also comes with some other interesting camera features such as the astrophotography mode and the built in pro-mode – latter capable of using not only the 50-megapixel primary lens, but also the 50-megapixel ultrawide and 12-megapixel telephoto lens on the phone.

## Xiaomi 13 Pro

The Xiaomi 13 Pro comes with a triple camera set-up on the back, with the primary lens being a 50MP 1" sensor, that's paired to a 50MP telephoto lens with 3.2x optical zoom capabilities and a 50MP ultrawide camera. All three are Leica tuned lenses which brings with it plenty

of benefits. Images clicked all three lenses, and especially the first one offer very little noise, and capture plenty of details. Going by the camera samples we clicked, images clicked using the phone look true to life, with impressive contrast and vibrant colours. One big change that Xiaomi's brought in this year with the 13 Pro in terms of photography performance is that resultant images don't look too processed and have a natural look to them. Thanks to the high megapixel count and impressive work on the software front, images clicked using the telephoto and the ultrawide lens also come out looking well-detailed. However, the results for these in low light aren't as great as what you'd find on the large 1-inch primary lens.

## Samsung Galaxy S23 Ultra

Samsung Galaxy S23 Ultra is the company's latest flagship and it was no surprise when it achieved very good results
