

in our camera testing. The S23 Ultra's cameras are headlined by a 200-megapixel lens from the company that offers good performance across varying lighting conditions. This lens can click some excellent shots with plenty of detail and good dynamic range even in tricky lighting scenes. The one advantage

that the S23 Ultra possesses over its competition is that it comes packing a very capable dual telephoto lenses. These are dedicated 10x lenses, which mostly provides consistent results while zooming in to create a frame. These have been backed by good stabilisation technology that also help the S23 Ultra from Samsung impress in the videos department. While the overall results are quite impressive and low light shots clicked using the phone are also good, it's important to note they aren't the best in the business, with the likes of iPhone 14 Pro Max and the Vivo X90 Pro shading the S23 Ultra in this department.

Google Pixel 7 Pro

Pixel 7 Pro is Google's flagship for the year, and brings with itself some really impressive cameras and photography smarts. The hardware driving the Pixel 7 Pro's cameras sees 3 lenses at the back, with the primary being a 50-megapixel one with f/1.85 aperture and laser auto-

focus. This lens is paired with a 12MP ultrawide lens that has a wide 126-degree field-of-view, and a 48MP telephoto camera with 5x optical zoom and up to 30x with Google's Super Res Zoom. However, the latter is nothing to write home about and only provides mixed results. However, the other two lenses, and especially the primary lens is capable of clicking some stunning shots. These shots are definitely an upgrade over the photos from the Pixel 6 Pro, which in itself should count as a win for Google. Thanks to its camera software, the Pixel 7 Pro manages to bring one of the more consistent picture taking experiences to a phone, with shots coming out vibrant and detailed in pretty much all lighting conditions. Making the Pixel 7 Pro the perfect phone for anyone looking to get their hands on a good point-to-shoot camera phone.

Google Pixel 7

Pixel 7 is the more affordable device from the flagship series this year. It comes with two lenses, with the first being a 50-megapixel sensor with OIS, PDAF and Laser-AF. This is a wide angle lens. Yes, this is the same as the Pixel 7 Pro's primary lens, and as such, is capable of capturing stunning shots with great amount of detail across varying lighting con-

ditions. Much like its elder sibling, it also takes advantage of Google's AI chops, and brings with itself Google's low-light night sight mode, which is feels more advanced than ever before. This mode is especially useful for those looking to shoot a lot of pictures in low light where this mode can help click well-detailed

and crisp shots. Pictures clicked using this lens also come out with plenty detail. The Pixel 7 is also good for users looking for good video performance.

Moto Edge 30 Ultra

Much like the Samsung Galaxy S23 Ultra, the Motorola Edge 30 Ultra is also a phone that uses a large 200-megapixel sensor for its primary lens. However, unlike the Samsung phone which uses the latest HP2 version of the lens, the one on the Edge 30 Ultra is the previous generation HP1 sensor from Samsung, which results in

slightly less detailed images when compared to the S23 Ultra. This gulf in image quality only increases when we start comparing low light shots, with the Moto Edge 30 Ultra's low light performance being hamstrung by its under-powered camera software. But overall, the picture quality still remains more than acceptable on the phone.

Apple iPhone 14

Unlike the iPhone 14 Pro Max which brings powerful new hardware, the iPhone 14 relies on similar hardware as its predecessor, the iPhone 13. But we still do get some important improvements that make the iPhone 14 a worthwhile investment.

Running the show we have a 12MP primary wide-angle lens which has been paired to a 12MP ultra-wide lens. Despite the sporting the same megapixel count as the iPhone 13, the iPhone 14 does bring important changes. For example, the primary lens gets a bigger f/1.5 aperture and also a larger sensor which helps improve the low light performance on the phone. Over and above this, we also have Apple's new Photonic Engine, that improves colour reproduction in photos. All of these combined, help the iPhone 14 become one of the best camera phones in the country.
