

JBL Tune 130NC

JBL's Tune 130NC are the black sheep in JBL's TWS lineup. Why? Despite having the label of having "Pure Bass Sound", the sound signature of these earbuds is surprisingly neutral, which is a great thing to have. These earbuds have a

lightweight design and around eight of battery life on the earbuds. However, that is where our praise would stop. Their ANC is nothing special and the lacklustre sound stage means that you lose out on the overall listening experience. With a little more love and attention, these earbuds have the potential to move higher up the list. But until then, they stay at number 5.

realme Buds Air 3

One of the few earbuds in this list with ANC, the realme Buds Air 3 are a great pair of earbuds in their own right. At ₹3,999, these earbuds bring along stunning design for the price, a great app, multipoint connectivity, and a sound signature

that might be slightly unbalanced for some, but holds its ground for the most part. These earbuds have a plethora of features packed in, some that we'd not find in earbuds that are priced higher than these. realme Buds Air 3 have IPX5 water resistance making sure that you can go out in the rain without much worry. While you are out, the 30 hour total playback time on these earbuds ensures that you don't need to recharge them frequently.

OnePlus Buds Z2

The OnePlus Buds Z2 are the first of the two OnePlus earbuds featured in this list. They have the rarely found ANC in this price, which is nothing write home about, but is serviceable in day-to-day use. In terms of the sound quality, we

can easily label them as a bass lover's dream. These earbuds have a subtle boost in bass, which does not eat into the mids and the highs, making sure that all the frequencies in tracks across most genres are well represented. All this is packed in a sturdy case, and is powered by a battery on the earbuds that will last you about 4 hours and 30 minutes, with the total battery life, including the case, coming up to 40 hours.

Oppo Enco Air2 Pro

Oppo's only entry in this list, the Enco Air2 Pro, features 12.4 mm titanium drivers, which are a rare find at this price. Due to this, the sound signature does not have an abnormal boost in either the bass, mids, or highs, although,

compared to the others, the bass is on the higher end. These earbuds also have ANC which is decent for starters. The claimed battery life on these earbuds is 28 hours, which when pitted against some others in this list, seems low. And, lastly, the IP54 rating on these earbuds means that they can be lightly splashed with water. Do not take them out for a swim, else you will return with a dysfunctional pair of earbuds.

realme Buds Air Pro

The realme Buds Air Pro bring in 10 mm Bass Boost Drivers, quick charge technology with 25 hours of claimed total playback, ANC, and Bluetooth 5.0. The claimed latency on these earbuds is 94 ms, but I have seen cheaper earbuds with

better latency than these earbuds. They look great and have a sturdy feeling case. If you are someone who is fond of bass-boosted sound, then these are the perfect buy for you. The S1 Chip handles the ANC decently, but again, as it is the case with many other offerings on this list, that is nothing special. You just get a taste of what ANC actually is. The earbuds are light, and should make for a decent pair of daily drivers.

OnePlus Nord Buds 2

The OnePlus Nord Buds 2 are another pair with a sound signature that has a lot of bass. This boost in bass, eats into the response of the highs, meaning that when you are listening to songs that feature high pitched instruments or very sharp

notes in vocals, you will be left looking for those sound amidst all the boom. The ANC on these earbuds is decent which coupled with the fit, which was awesome when we tested these earbuds, makes sure that you are not troubled by noise around you. They have great connectivity, and a battery that lasts around four and a half hours on a single charge. **d**
