

Apple's included ear tip fit test, which does not work on Android devices, helps them race ahead of the competition. The test helps you verify whether the ear tip that you are choosing is the right one for you or not. However, if you are an Android user, you will get the great ANC that these earbuds have to offer, you will miss out on the fit test, and as I found out in my time spent with these earbuds, it could actually make a difference.

Sennheiser Momentum True Wireless 3

Coming from the last two generations of the Sennheiser Momentum True Wireless Earbuds, the Sennheiser Momentum True Wireless 3 earbuds show considerable

improvement in the ANC department. With its performance in the low frequencies, it makes sure that most of the rumblings that you'd otherwise hear during your flights or auto rides are cancelled out. Additionally, if you are around whiny computers and other machines all day along, their performance in the highs also adds to the reasons you should consider these TWS earbuds if you're looking at ANC performance.

Sony LinkBuds S

Bringing the Sony WF-1000XM4 DNA in a slightly more affordable package are the Sony WF-LS900N also called the Sony LinkBuds S. Given that they pack the same hardware on the insides as the Sony WF-1000XM4, Sony's flagship,

the LinkBuds S, for the price offer the best ANC performance. You might be surprised by their performance in the low frequencies. However, their fit makes up for the lost ground in other frequency ranges, and with the proper fit, you will be able to almost replicate the performance of the pricier 1000XM4(s) on a budget.

Google Pixel Buds Pro

Google Pixel Buds Pro make an entrance at number 7 in this list. These earbuds are touted to be the ultimate TWS earbuds for Android users. However, they pale in comparison to their competitors, which bring in a

ton of features, and much better ANC. While the ANC on the Google Pixel Buds Pro is definitely serviceable, when you are in environments with a lot of noise, some of it tends to creep in, and you will be able to hear a hissing sound. Like the AirPods Pro, they have their own variation of the ear tip fit test, but it is of no match to Apple's implementation.

Jabra Elite 7 Pro

Jabra's earbuds are known for their solid fit. And, that is the case with the Jabra Elite 7 Pro. The inherent ANC on these earbuds is nothing to write home about. However, coupled with their excellent versatile fit, it makes a strong case for itself.

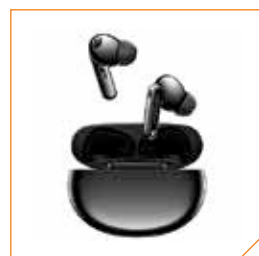

In noisy traffic, you will get some amount of ambient noise seeping through. However, if you are someone who uses ANC in indoor environments, with the only sources of ambient noise being home appliances or people speaking, then these earbuds should be fine.

Nothing Ear (2)

A visually striking pair of earbuds with features and ANC complimenting their bold looks, the Nothing Ear (2) are the ones to go for, if your budget is around ₹10,000. They are the latest from the house of Nothing, and in my

time with these earbuds, I found their ANC to be perfect for indoor and slightly noisy outdoor environments. However, if you are planning to wear these during your auto rides or flights, then you would definitely catch a glimpse of the ambient sound in what you hear after you've put these on.

Oppo Enco X2

The most affordable offering in this list alongside the Nothing Ear (2), the Oppo Enco X2 offer the best value for money of all the earbuds that are mentioned here. Their ANC is definitely better than the competition in its price range, with

the Nothing Ear (2) inching ahead, mostly because of the design of the earbuds, which offers better fit, resulting in better ANC. The ANC is of no match to some of the heavy hitters in this list, but for daily use, it is hard to find a better package, including the features.
