

Gaming Keyboards

Nothing can beat the WASD feel

Manish Rajesh | manish@digit.in

Gaming keyboards are more than just tools to type on. You have to consider a lot of things when you're picking the best gaming keyboard for yourself, this includes the kind of switches you want, the size of the keyboard, whether you want it to be wired or wireless and a host of other features. In this list, we've covered a wide range of gaming keyboards, from super premium options that have all the features you could dream of, like the Corsair K100 RGB, the ASUS ROG Claymore II and the Razer Huntsman V2, to some no-frills options for the no-nonsense gamers out there, like the ROG Strix Scope RX and the Cooler Master CK352. Of course, we've included some budget options as well, like the Redgear MK853 Shadow Blade for example, which might just surprise you.

Corsair K100 RGB

The Corsair K100 RGB replaces the Corsair K95 Platinum as our best keyboard. The K100 RGB is the first keyboard to feature an SoC in it.

Yes, you read that right. You've

an AXON SoC inside the K100 RGB, which now has multi-threading. All of this allows the K100 RGB to have a polling rate of 4000 Hz. For reference, the typical polling rate in most gaming peripherals is 1000 Hz. However, we should point out that this doesn't necessarily translate to major performance gains, few (if any) humans can actually respond to things that fast. The K100 RGB features Corsair's new optical-mechanical switches. We thoroughly enjoyed our time typing and gaming on this keyboard. You also get all the dedicated keys you can think of. All of the pre-existing features from the K95 also carry over, such as the PBT keycaps and the cushioned wrist rest. Of course, this package doesn't come cheap at all, but that's to be expected for what is arguable the best in the world.

ASUS ROG Claymore II

We didn't really think that the K100 RGB would have too much competition but coming in at a close second we have

the ASUS ROG Claymore II. This keyboard also features ROG's own ROG RX Optical switches, and when it came to typing and gaming experience, we honestly couldn't tell the difference between these

and Corsair's OpX optical-mechanical switches in the K100 RGB. What makes the Claymore II special is the modularity. That's right, you can slide the numpad right off. If that wasn't enough you can then attach the numpad to the left side of the keyboard, making this the only ambidextrous keyboard we've tested in a weird way. The numpad also hosts four extra macro buttons which are right under the volume dial. You also get a nice cushioned detachable wrist rest, USB pass through when the keyboard is in wired mode, and an LED indicator near the top left for battery. Once again, like the K100 all of these premium features come at a premium price point but you can go wrong with the ROG Claymore II either.

Razer Huntsman V2

We've done Corsair and ASUS, now it's Razer's turn. The Razer Huntsman V2's claim to fame is a polling rate of a whopping 8000 Hz. If the K100 RGB is 4x faster than

conventional keyboards, this keyboard is 8x faster! Again, it's unlikely that humans will ever move that fast, but if we ever manage it, we know there's a keyboard that can register our speed. That's just one thing though, this premium keyboard has a lot more to offer, including top notch build quality and doubleshot PBT keycaps, dedicated media keys, a volume dial, a cushioned magnetic wrist rest, and the ability to program two functions into a single key via Razer's software. Oh and we've got Razer Optical switches as well. Once again, we had a great typing and gaming experience with this keyboard as well, it was incredibly hard to rank these three keyboards. That said, you won't go wrong with any of the three keyboards so far, so decide based on your needs, all them come at a high premium.
