

Apart from deep blacks and multiple HDR formats (including Dolby Vision IQ), the TV also supports IMAX enhanced, which means you can enjoy an immersive home theatre experience in supported titles like most Marvel Studio movies on Disney+Hotstar.

The Xiaomi OLED Vision TV ships with Android 11 TV OS with the redundant Patchwall launcher. The TV has HDMI 2.1 features like ALLM and eARC, but the display refresh rate maxes at 60Hz. So, perhaps this won't be as appealing for a few hardcore gamers.

Samsung QN95B Neo QLED 4K Smart TV

Many users prefer mini-LED TVs over OLED for their living rooms. Since these TVs have a backlight instead of self-

emissive pixels, they can get a lot brighter than OLED TVs. Samsung's QN95B Neo QLED 4K Smart TV is a mini LED TV with full-array local dimming that can significantly boost contrast.

It comes with a number of appealing gaming features including support for 144Hz refresh rate and four HDMI 2.1 ports that can be easily accessed via Samsung's One-Connect box. Samsung uses its own proprietary custom interface that is well-designed and easy to use. Like all Samsung TVs, this one also misses out on Dolby Vision HDR which is a bummer.

Sony BRAVIA X90K

Sony X90K is a LED TV with a VA panel and it benefits from Sony's upscaling, colour and motion-handling expertise. It is worth consid-

ering if you are looking for a living room TV for watching multimedia content. The TV comes with Acoustic Multi-Audio technology, meaning the sound appears to emerge directly from the screen.

The TV is available in three sizes - 55-inch, 65-inch and 75-inch. It runs the Google TV interface and is also compatible with Apple Airplay and Homekit. If you'd rather prefer a Sony TV with an IPS panel that offers wider viewing angles (but lower contrast) than VA panels, you may also consider the lower-tier Sony X80K instead.

LG QNED 81

If you are particularly looking for a high-end TV with an IPS

LCD panel, LG's QNED 81 series is worth considering. LG's QNED TVs combine Nanocell technology with Quantum Dot Enhancement Film (QDEF) to achieve a wide colour gamut, but unlike

the higher-end QNED TVs, this one doesn't have a mini LED backlight but includes local dimming support.

The LG QNED 81 TVs are available in three sizes, but the 55-inch makes the most sense. It supports many gaming features like 120Hz refresh rate, HGiG Mode, and HDMI 2.1. It's also missing Dolby Vision and HDR10+, so in India your HDR experience will mostly be limited to HDR10.

OnePlus Q2 Pro

The OnePlus Q2 Pro offers great value for a 65-inch TV. The primary highlights are its 120Hz QLED Panel with a peak brightness of 1200 nits and 70W soundbar

mounted at its base for impactful audio. OnePlus further claims 97% DCI-P3 coverage. The native contrast of the panel is slightly on the lower side, but that is contracted reasonably when you turn on local dimming.

Other mainstream features like Dolby Vision and HDMI 2.1 connectivity are also covered. The OnePlus Q2 Pro runs the Google TV interface and also integrates OxygenOS 2.1 in India to curate local content, just as Xiaomi does with its PatchWall launcher.

Mi Q1 Series 4K Ultra HD Smart QLED TV

When it comes to choosing the right TV display size, bigger is almost always better. If you are looking for an

ultra-immersive large-screen TV experience, this one offers amazing value. The 75-inch 4K QLED display has a 120Hz refresh rate, Full Array backlighting and comes with 192 dimming zones to boost contrast. All popular HDR formats including Dolby Vision are supported.

The TV supports HDMI 2.1 features like ALLM for gaming and eARC with Dolby Atmos passthrough. The metallic side frame gives the TV a durable and premium feel. The software is Android TV 10 with Xiaomi's Patch-wall launcher bundled along.
