

22 TIPS TO HELP

YOU SUPERCHARGE YOUR SMARTPHONE

Making sure that our best pal runs better and longer

Druti Banerjee | feedback@digit.in

W

hen you change your phone and get your hands on the latest smartphone in the market, you are flabbergasted by the speed your phone works at. But as the months roll by, the speed your phone goes on a downward spiral. Hence, one of the most searched questions about smartphones is, 'how can smartphones run faster?' or something on the similar lines.

So, let's have a look at 22 tips to help your smartphone run smoothly.

01

Uninstall all unnecessary apps

When you install an app, it simply leads to using up or consuming memory. As you keep installing apps, your smartphone's memory tends to keep on getting cluttered. This leads to your smartphone losing its speed.

At times we install apps thinking that they'll help us by clearing up some space. But, as soon as the fixing is done get rid of them. If you keep the app it will simply result in using up your phone's data, storage and also battery.

There are apps which are in-built on your phone. You can't uninstall them, but you can easily disable them. Do that!

02

Keep your phone up to date!

The way keeping yourself updated about the world by reading up everyday helps you, the same way phones need to be up to date as well. Keeping your phone at par with all updates will prevent any sort of lags and bugs and if there is any prevailing issue it will automatically get solved. Always keep in check if there is an OS update available for your phone. Then

you should absolutely get it done as that would solve half of your life's problems.

Not only the OS, but apps receive updates every now and then, and the update is necessary for a smooth and seamless experience with the app and the phone.

03

Clear your cache

If you are not aware of what cache is, then let me tell you it's nothing much but it is a stash of data from different apps and services that keeps increasing. It helps apps load faster, but sometimes it can do more harm than good. So, its recommended you clear your cache once in a while. Here's how you do it:

- Go to settings and scroll down to apps
- Select app management and then select the app you want to clear the cache of from the list
- Go to storage usage
- You'll get to see the cache and the data used written there. Just below that is the option names as clear cache. Tap on that and that's it.

The best option would be to clear the cached data of apps which you barely use.

04

Control your internal memory

The simplest method to help your device run faster and smoothly is to keep it as light as possible. So, all your media files get stored to your smartphone's internal memory, hence causing all the various issues. It's best to upload all your files on cloud and free up your internal storage giving the phone space to breathe and other apps to function smoothly without any lags. As, more apps and files on your phone just makes it heavier and difficult to function and results in slowing it down.
