

driver with your hardware is an essential point. Next, scan for all the updated ones and install.

Automatic driver update - If you are not much aware of how things are done on your device then it's best to adopt the automatic method of updating your driver. What you need is Driver Easy. Install Driver Easy on your laptop and after you run it select Scan Now. Driver Easy will scan and get all details of your laptop and then you need to click on Update or Update All.

06 Keep a check on the visual effects

Visual effects include things like animations, transparency, fading etc. These are heavy for the laptop as these keep on running in the background and hence not allowing your laptop the breathing space that it requires. So, you need to check and adjust these effects. For that the following steps are to be done and taken care of-

- First, go to Control Panel
- Then, go to System and Security in the Panel
- Then in the next menu go to System
- After that, System settings
- There you will get the option of Performance. Go to settings i.e. the Performance, and then the drop down option will give you all the possible ways you can adjust the visuals

Beta would be to select the option of "Adjust for best performance," this would remove the visual effects. You can also opt to manually remove them individually as well. Definitely try and avoid the fade and shadow options, they cause the utmost trouble to your laptop.

07 Add up RAM

Installing extra Ram takes around an hour if you are aware of how that is done, else you can simply contact an expert who will help you out with it. We have already spoken about the importance of RAM in the previous story, so won't be repeating that here.

08 Always look out for notorious software

With us always being on the internet, it is impossible to not come across or get affected by some virus, malware or spyware. You never know when this happens. So the best option is to use any software that would take care of it like presently the Windows Defender has been very useful. You can also think about some third party programs. You just need to install them on your laptop and they are exactly the same way effective at detecting the problems of your laptop. But be very mindful of what you are using as some applications will eliminate the problem causing virus but sit in your laptop and eat up space making it slow immediately. So, know what software you are using before you install it for the work.

09 Consider an SSD

SSDs aka Solid State Drives are one of the easiest ways to increase your device's performance. They are faster than conventional Hard Disk Drives and more reliable as well. Some laptops do not support internal SSD. Then you can always kept for the external one. It will give all your applications a boost and indirectly a boost to your laptop as well. Before you get the SSD research about it and be clear about what you need your laptop for. Accordingly, a compatible SSD would make your life much easier.

10 Get rid of temporary files, software, and programs

When you purchase a laptop, that already comes with a lot of software or

programs. Mostly there are a lot of programs that you are never going to even use. When you don't use an application ever or for a very long time then you definitely will receive pop-ups saying that you should update the program as you have never used it. In that case it will just remain as clutter and eat up space from your laptop and of course leading to the system facing a lag. Simple thing to do is get rid of such programs for once and all. Remove them from the system and free up the space.

11 Keep everything updated

Be it your windows or the smallest program present on your laptop keep it up to date always. If you don't update something and try using it regularly, it will automatically lag. Everything needs a boost and all the programs or softwares get a boost with new updates. So, as soon as you update you'll see that neither the program will lag nor will your laptop. Updating not only boosts but also helps your laptop ease up.

12 Find programs that eat up resources and eliminate them

At times it's a particular program that is to be blamed completely for the laptop to slow down or not run smoothly. To solve that issue, the program needs to be identified and taken care of. The best way is to go to the task manager and track it down.

At Task manager you can go and check every detail of all the programs that are running in your laptop. Go under every tab and get the details and you'll understand which particular program is taking up the space and making your laptop slow. Here you can actually close that application. In case if the application doesn't close then just end the task for that particular program and you'll be done.

13 Close all Browser tabs

Sometimes if a lot of tabs are open on your browser then it causes a
