

lag as well. Restarting the browser won't help, you need to close all the tabs down. If you always open ten or more tabs at the same time, you will definitely face an interruption while working. It will slow down, or will lag or might just stop working all at once. Best thing to do would be exiting a tab as soon as the work is done instead of just keeping it there lying.

14 **Reset your laptop**
Sometimes you don't have any option but to give a total new start to your laptop in that case you'll have to store all your necessary data somewhere and then factory reset the laptop. This might just happen that you'll not be able to track down the real

problem behind the lag. So, the best would be to clear out the entire laptop and start it like it's brand new. So, make sure you have saved your essential files somewhere and then directly reset the entire laptop.

15 **Religiously clean the laptop to avoid dust buildup**

People will never take this seriously, but dust build up and an unclean laptop will definitely result in your laptop getting slow. When dust accumulates, it obstructs things internally as well and results in overheating of the laptop. This can turn out to be a major cause of reduction in the performance or the laptop slowing down.

But make sure while the cleaning process is on, any of the parts do not go

through any sort of harm. That would definitely lead to a bigger problem.

16 **Disable Cortana if you have Windows 10**

Cortana is a digital assistant, if you have Windows 10. It is no doubt really helpful but it definitely indulges with a lot of resources and also can breach your privacy. So, as it uses up the resources, this leads to the laptop getting slowed down and also privacy is a big concern here which might lead to malware issues. Hence, the best option would be to get rid of Cortana if you think about the welfare of your laptop.

17 **Remove unused browser extensions**

As already discussed if a lot of tabs are open, that directly affects the speed of the laptop. Similarly, if you have a number of browser extensions, it simply just runs in the background and uses up your storage and clutters your laptop resulting in the device slowing down. Hence, the best option would be to get rid of such extensions and especially when you are not using them for a while now.

18 **Restart your laptop regularly**

Your laptop needs breathing space too. If you keep your laptop switched on the entire day it will just be a way to strain it out. Everybody needs rest and so does your laptop.

As soon as you switch off your laptop or restart it, all the programs running in the background shuts down as well clearing up the clutter again. Automatically helping the laptop rest for a while. So, when you turn it on again, it will be much smoother to work on than keeping your laptop on always.

19 **Speed up Disk Caching**

Disk Caching or Disk speedup helps run the hardware better. It will analyse and look into the drives that are

somehow related to your device. As soon as it is done with the scan, the laptop goes for a reboot. This results in the cleaning up of the laptop from the hard disk's point of view. Too much clutter if the disk again leads to the same lags. Hence, Disk Caching is crucial in its own way.

20 **Turn off search indexing**

The search indexer uses up a laptop's resources. This happens again in the back-end and you are never aware of it. It basically helps you find any certain file or text or anything similar. But, this isn't much of a necessity. So, you can turn it off anytime because if it's on at all times this would again lead to the same lagging of the device because of the back-end work and cause problems for you in regard to working on the laptop. Hence, disabling it is the best solution to safeguard your laptop's performance.

21 **Clean out Registry**

The registry is meant for system hardware details. But at this point the registry's maintenance isn't much looked into. This would simply store up unnecessary data on your laptop which you might never need in the future. So, its best to look into it and get rid of what's not required and keep it clean for the betterment of your laptop.

22 **Optimise your system**

Over the years, the performance of the laptop degraded due to the various reasons mentioned above. But, of course a solution is required. You might give a thought of a factory reset. But that can just be an option. Instead you can optimise your device by using tools like Restoro.

Restoro scans your laptop for free looking for any issues and detects it for you. Once the detailed report is in your hand, you can easily think of any of the above solutions according to the problem that has risen.
