

However, enabling this impacts the HDR setting of your TV in some cases. So, if you are a stickler for good visuals, you should disable power saving. To disable Power Saving setting, follow the below steps;

- Settings > General > Power Saving/ Energy Saving Mode > Disable/Turn Off
- You can also opt for Adaptive Settings. This will allow your device to balance the HDR setting according to the content being displayed on the screen.
- You can find the Adaptive settings under General > Intelligent Mode/ Automated Mode depending on the device's brand.

08 HDMI 2.1

HDMI 2.1 has come with a slew of features that few people know about. So, make sure that your TV is using this latest standard, instead of defaulting to an older one. You need to manually switch to HDMI 2.1 and once you have switched the settings you can change the setting where you select the settings for HDMI 2.1.

09 Auto-brightness and Auto-backlight

Auto-brightness or Auto-backlight adjusts the backlight of the television set based on the illumination of the room. This is an intelligent feature that smart TVs have to offer to increase the visual experience of the smart TV. Remember to switch off the auto brightness option and manually adjust the brightness to your optimum viewing. Especially, when the video playing is shot in dark backgrounds due to auto brightness there are a lot of details that are lost in the process.

10 Automatic updates

Automatic software updates could consume extra bandwidth and resources in the background. Your TV might operate slowly as a result of this. It is therefore advisable to disable Android TV's automatic updates.

11 Reduce Animations

On your Android TV, you may limit animations to make the

UI feel quicker and snappier, similar to how you can on Android phones.

- Navigate to Developer Options
- Under Drawing, scroll down to animation scales.
- Set Off or 0.5x for each of the following values: Window animation scale, Transition animation scale, and Animator duration scale.

12 Turn off usage Diagnostics and Location tracking

The speed of your Android TV would be slightly enhanced by disabling usage diagnostics and location tracking. This is due to the fact that apps frequently retrieve information about your location in the background and the system is always informing Google about what is functioning and what is not. The following steps will stop both processes.

- On your Android TV, go to Settings.
- Click Location under Personal as you continue to scroll down.
- Select Location Status from here.
- Switch the toggle off.
- Return to Settings now and select Usage & Diagnostics.
- To turn the toggle off, disable it.

13 Limit background processes

You can set a maximum for the number of background processes

that can be run using developer options. While limiting background activity could result in the termination of background programmes, it does enhance the efficiency and the ease of use of the Android TV interface.

- On your Android TV, go to Settings.
- To find About, scroll below. Tap the Build number seven times to activate developer options.
- Return to Settings > More Settings > Developer Options (you might find it under Additional Settings on some TVs)
- Select Background Processes Limit by scrolling down.
- Select a maximum of 1 or 2 processes.

14 Use LAN over Wi-Fi

On your Android TV/Smart TV, a LAN connection is always recommended over WiFi. This is due to the fact that WiFi connections frequently experience delays and buffering because of many factors, including obstacles. These problems are resolved by obtaining a direct wired connection from the router. The majority of the time, everything will stream smoothly and load quickly.

15 Tweak The Equaliser

In your sound settings, an equaliser (EQ) may be present. The EQ allows you to adjust the TV sound signature. To make your sound brighter
