16 Switch Sound Mode
Similar to "Picture Mode" in your TV's settings, sound modes are pre-set choices that let you manage the audio on your TV. The sound settings available on Samsung TVs for example, include Standard, Movie, Music, Amplify, and Clear Voice. You can select the pre-set sound mode for the content displayed on your screen. A appropriate sound mode can enhance the sound quality of any streaming media.

17 Use external speakers
You should first be aware of your TV's speaker addition possibilities. There are a few approaches to take, and one may work better for you than the others. For stereo speakers, you can use a 2-channel hi-fi amplifier, or if you want surround sound, you can acquire an AV receiver. The audio output on contemporary televisions often uses an HDMI ARC link or a digital optical output. Both will be present on many TVs, and you can decide which is more practical to use.

18 Use your phone as the remote
The remotes that are included with Android TV boxes are excellent. However, especially when you need to

input text on your TV, these Bluetooth remotes are only so easy to use. Fortunately, Google offers a free programme called "Android TV Remote Control" that allows you to access a remote interface on your smartphone. The best part of this is that you can use your mobile's on-screen keyboard to enter text on the Android TV when needed. This is much quicker than employing the lean-back keyboard that Android TVs ship with.

19 Enable picture in picture mode
The smart TVs have now been advanced to multi-link features for device content screening which has enhanced and elevated the PiP setting. You can now have two screens from two different content streaming platforms, provided the device offers it.

Recording on TV with input devices is a piece of cake as they use time-shifting APIs, however you can also automate content recording on your TV within a few steps and once the content is recorded you can simply browse and manage the file on the device. You extend the linkage and record the content on external devices too for instance, laptop and smartphones.

21 Enable parental controls
TV in India has traditionally been a family commodity. Now, with internet access coming on to TVs parental controls are more important than ever, simply to improve and maintain a balance for the children and keep a check on the content they are watching.

22 Utilise HDMI-CEC
For our last tip for this section, HDMI-CEC refers to HDMI Consumer Electronics Control which suggests that multiple devices are handled by a single remote. This enables the user to have multimedia control over the devices. Now, most TVs have the feature disabled from the manufacturer's end which leads to the feature being hidden. You can find the feature in the settings itself or you can just search for the exact instruction guide for your TV by entering the TV model number with an added HDMI-CEC.
