

22 TIPS TO SUPERCHARGE YOUR PC

Well, do you really know your PC?

Ichha Sharma | feedback@digit.in

If you are a part of the glorious PC Master Race, then you know that there are a ton of settings that are might have slipped past you. However, worry not. This list of tips will make sure that you are getting every bit of performance you paid for.

01 Get a power efficiency report

Efficiency calculator helps in generation of information about the device's power consumption. IPowercfg -energy command can be used to procure an energy efficiency report and collect power configs for power management.

1. Start an elevated command prompt in Windows 11
 - Start > type command prompt in the Start Search box > right-click Command Prompt > Run as administrator.
2. At the command prompt, type powercfg -energy.

3. Type energy-report.html to open the report in a browser.

Once you receive the report you will be able to identify all the issues that are currently prevailing in the system and can rectify them to have a better performance.

02 Disable unwanted start-up programs

As the name suggests, unwanted start-up programs pop up when you switch your device on. Now, to tabulate and eliminate start-up programs on your PC, you can do the following -

1. Check out the applications that are currently running in the Task Manager.
2. Then, go to Start > Settings > Apps > Start-up
3. In the start-up area you will find the applications that you can disable, if not in use.

There is another shortcut that you can bring in practice if you want to check what start-ups are open in seconds.

1. Windows > Search 'msconfig' > Enter

2. In the dialogue box, Start-up > Task Manager > Select Program > Right Click "Disable"

Note that even if after disabling the program it starts automatically, check your PC for any viruses or malwares.

03 Tune visual effects

No doubt that visual effects make the interface of the device delightful and smooth, however there are certain visual effects that can be turned off in order to reduce the time the device takes to perform a task. To do this, visit the Control Panel and choose System under Systems & Security. Select the Advanced tab in the System Properties dialogue box by clicking Advanced System Settings on the left. Click Settings under Performance. Then select "Adjust for best performance" from the Visual Effects tab's checkbox and press OK.

04 Update Device Drivers

Device drivers are a major contributor to Windows 10's troubles with dependability and poor performance. Check the manufacturer's website for updates if it appears that a driver may be the problem. The setup of generic drivers that can obtained directly from the manufacturer. If the manufacturer has provided Microsoft with fresh device drivers, Windows Update also offers them.

05 Modify Virtual Memory settings

The virtual memory settings can be changed by users on the Advanced tab of the Virtual Memory section of the settings menu. Users may choose to give Windows control over the paging file, which Windows utilises to act as though it were RAM if there is adequate disc space. If necessary, change the size of the file by selecting Change or relocate the paging file to a faster disc.

06 Use OneDrive Files on-Demand

On Windows PC, OneDrive is the default solution for cloud storage. However, when you are saving your files on
