

15 Add More RAM

We know that a lot of apps that we use daily, *cough* Chrome *cough* can be memory hogs. So, it is always a good idea to have at least 16 GB of RAM on your system. With DDR5 coming in, people running DDR4 based systems could get great deals on RAM kits, so keep an eye out for that!

16 Disable automatic updates

In most cases, it would be beneficial if you did not turn off automatic software updates. It is the simplest approach to prevent any vulnerabilities cropping up on your computer, keep it secure, and solve compatibility problems. However, sometimes the latest updates pushed out by OS developers aren't the most stable ones. So, we'd say it is better keep manual checks on Windows updates and install them once you know that the build that has been pushed out is stable. As for other programs, background updates can hog on a lot of your bandwidth so, it is better to have background updates disabled for programs that are not essential for you.

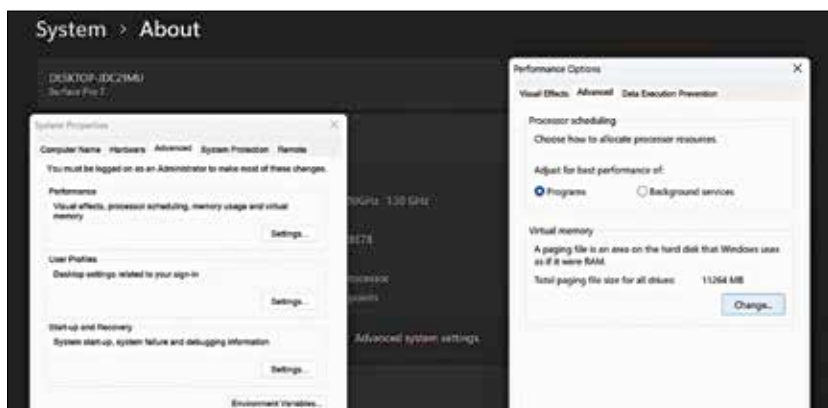

17 Defragment Drives

As the name suggests, defragmentation refers to the activity of reversing fragmentation that is performed by the computer to ease out the internal processes and break them into small tasks. However, this may help the tasks but as a whole this is just extra work which eventually slows your PC down.

18 Manage Virtual Memory

Virtual memory is nothing but your system trying to ease the performance of the computer by adding temporary memory to the computer. This memory is taken from a part of your hard drive and then transformed into a supplement when RAM cannot run a lot of programs. It goes without saying that if you want a better performance for the system you should increase the virtual memory and here is how you can do that.

1. Open Control Panel > System and Security > System

2. Advanced System Settings > Advanced
3. Select Performance > Settings > Advanced tab > Virtual Memory > Change

19 Install an SSD Startup Drive

With an SSD, setting up and operating demanding programs like Adobe Photoshop happens significantly faster. The startup of Windows is also substantially enhanced by an SSD. The Apps and Features page in Settings makes it simple to transfer apps from the Microsoft Store to an SSD. It makes sense to substitute your inbuilt startup hard disc for system speedup, and if you employ a laptop, this might also be a choice for you. However, apps that require a lot of storage can benefit from a speed increase from an external SSD with a USB 3.0 connection.

20 Turn on ultra-low latency mode

The games you're playing should preferably support Nvidia Reflex for the optimum performance, but Nvidia's Ultra-Low Latency Mode also gives your machine a boost and lowers latency.

You can access this setting via the Nvidia Control Panel:

On your desktop, select the Nvidia Control Panel from the context menu. Navigate to the left to control 3D settings. Find "Low Latency Mode" by scrolling down in Global Settings, and then choose Ultra from the drop-down menu.

21 Clean Up Drive

As the name suggests, it is as simple as removing the baggage from your system that is pulling it down and most of us take this for granted and do not take a proactive effort. However, you should regularly check up on the optimisation of the device and clean up the drive.

To clean up your drive, search Disk Cleanup in the taskbar and then select File to Delete and hit Ok. You can also extend this and clear up systems by selecting clean up system files.

22 Automate Tasks with Task Scheduler

Our last tip for this series of tips and tricks will leave you handling fewer things on your system. With the following steps you can automate tasks on your computer and schedule commands for apps and more.

1. Automate A Program
 - Open Task Scheduler upon searching in the Start Menu
 - Action > New Folder > Create Basic Task
 - Task Frequency (Daily, weekly and others) > Start Time > Duration
 - Hit Start Program > Select the app > Finish
2. Automate A Command
 - Action > New Folder > Create New Task
 - Windows Auto-lock > Security options > Triggers > New
 - Begin A Task > On a Schedule > Start A New Program (Action > New Folder) > Program script: rundll32.exe
 - Add 'user32.dll,LockWorkStation' for Add Arguments **d**
