

Wi-Fi 7

Faster than ever. But, how effective?

Ichha Sharma | feedback@digit.in

While we were still getting accustomed to the setup and the speed of Wi-Fi 6E, the market is being hit by Wi-Fi 7. Yes, we are already talking about 4.8 times the speed of Wi-Fi 6. Now before we get into the nitty gritty of the router, let's understand why there was a demand for Wi-Fi 7 in the market when 6E launched recently. The primary motive of Wi-Fi 6 was to adhere to the growing number of devices and make a seamless platform for the transitional phase post-pandemic. Wi-Fi 7 is being introduced to transform the network speed and elevate the optimum use of multiple device connection.

Now the question that arises is, is Wi-Fi so significant that there have been so many developments in the routers, if yes why should we care?

Technological advancements have become a perennial discourse for society. Yes, we're taking that big of a spectrum. The interdependency of society with technology is underappreciated. Hence, when we talk about advancement we are always taking a leap of faith. Whether it is with the first launch of Apollo or with artificial intelligence. We have always

debated the need for an advanced device and it being ahead of time. Wi-Fi 7 comes under the same criteria, the technology is introduced to support faster network speed for multiple devices at the same time. It is a little more complex than that but the base is to attain faster speed in delivery of data on communication devices.

Let's get to the fundamental idea of Wi-Fi, where most of us limit the device to domestic use for our home networks, this is not the case. Wi-Fi is an extensive local area network (LAN) device which enables the users to connect the devices with a modem that can also help you integrate the devices to the Internet. Majorly, centralisation of devices for the network is achieved without any tangling of wires. Now

when you branch out from domestic availability to larger institutions, you realise how important the device is for local network connectivity. The elementary usage of Wi-Fi allows LAN, local area networks, which is highly functional in corporate organisations, public arenas, educational institutes, laboratories, hospitals and others.

Coming back to our question, what is the need for Wi-Fi 7? Advancement in technology requires spine support for delivery. You can have the most powerful device but if you cannot render it to people who need it, it is in simple terms, trash. The need for upgradation co-relates to the fact that change is the only constant and here with Wi-Fi 7 promising 4 times the speed that of 6 and 13 times more that of 5 gives the hope of technological transformation in hyperlocal networks. But before assuming that let's see the current status of adoption in India for Wi-Fi 7.

Wi-Fi 7: Specifications

Currently, there are more than 9 billion Wi-Fi devices and Wi-Fi 7 is here to amplify all the expectations. Let's see what all the device has to offer and why
