

is obviously very demanding as well because they're essentially paying a flagship phone price for a foldable. So I think what the flip delivers in terms of the experience is not something that people are wanting to compromise. But in essence, we're looking at people who are at the vanguard of tech innovators, so to speak, people who want to have the latest and greatest. And it's both men and women. But it's a very large audience now.

Q Can you give us some insight into OPPO's R&D for their foldable phones?

A There were two or three primary factors that we were looking at when we were creating this product. The first one was, once the Flip is unfolded, so to speak, we want to make sure that there's a seamless screen experience. So basically, how do we ensure that there's no visible crease? So that was the first pillar of product development that we had. The second one was essentially on durability. Now, as you'd imagine, with the form factor that looks like these consumers are worried about how long will the screen last? Can I be using this every day and still not worry about breaking the screen, etc. So that was the second one. Basically, in short, from a durability standpoint, we have a benchmark that meets consumer expectations. And the third one was just developed software solutions that make the users of the product intuitive, fun, which is why we've created a bunch of features in the phone. And these are not features that are being put into the phone just for the sake of it. It's very usable. And so for us, these are the three primary parameters that we created the product around.

Q You did speak about durability, and I think that's been one of the major pain points of having people adopt foldables as a form factor. So has the OPPO Find N2 Flip been thoroughly tested for durability, and is it certified in any way? And

how many folds can you tell us that it will last for?

A Yeah, absolutely. So obviously, the joy of owning an OPPO product goes beyond your first unboxing experience. So for us, it's really important for us to ensure that consumers have a seamless ownership experience from the day they buy it, right up to 7, 8, 9, 10 years. So in terms of the back end work that's been done, the phone is basically been tested for 400,000 folds by TÜV Rheinland, which basically means if you're folding and unfolding your phone 100 times a day, the phone will last you 10 years. So it's obviously a device that we're very extremely confident about. I think beyond that, from an OPPO stand-

point, we also pride ourselves in after sales service. We've got coverage in India in over 500 cities. And so anyone who's really buying this product is also going to have an amazing after sales experience of owning a robot device. So we've taken care of everything.

Q I think today in 2023, sustainability is a big driver for every company. So what has OPPO been doing to reduce its carbon footprint?

A Yeah, interesting question because we made a series of announcements recently actually around sustainability. Our ambition is to be a zero emission brand by 2050, that's what we're driving towards. But already I think there are things that we're doing with the packaging with regard

to just the development of our product, etc. One of the elements that we feel also drives the sustainability story for Oppo is the fact that we build our products to last. To give you an example, we recently launched the Reno 8, the Reno 8T. And those products, essentially, are tested for... The battery is basically tested for no lag, no latency, no loss of charging for about four years. We give updates in our products for up to three and a half or four years again. And so what that basically means is when you buy an Oppo product, they last longer. So at one level, from a manufacturing standpoint, point is obviously a sustainability target that we've set. But beyond that, even the products that we make, we're building them like tanks. So our hope, our endeavor is to make sure that when someone buys an Oppo product, that product works seamlessly for a very long time. And so on the Flip, it's 10 years of folding and folding. On the Reno, it's no lag performance for up to four years. Our battery technology again allows you to charge for up to 1,600 charge cycles. So all of these make our products special and more environmentally friendly.

Q When it comes to sustainability, I know a lot of brands who have taken a dig at Apple or Samsung for not including chargers and quoting sustainability reasons. Do you think Oppo is ever going to do that?

A For me to say something about a competitive brand, the choices they've made, not for us to think about or comment on. I think from our standpoint, we want to make sure that the consumer's experience of owning OPPO products is seamless. The kind of chargers that we put into the boxes are unique. We have SuperVOOC technology that our customers can take advantage of. And I think one of the things we say also is you should always use the right charger with the phone that it's built for. **d**
