Indian govt announces free malware removal tools

The security of users' devices is a growing worry due to the rise in malware assaults and frauds. The Department of Telecommunications (DoT) has released a number of free bot removal programmes to address this issue and help people protect their cellphones. To disseminate awareness, the government is constantly contacting individuals via SMS messages and has taken the initiative with the Cyber Swachhta Kendra portal. A botnet is a collection of computers, smartphones, or other electronic devices that have been joined together by 'bot' malware. Malware provides hackers power over infected computers after a device has been compromised and joined the botnet. This power gives them the ability to engage in a variety of nefarious behaviours, such as sending spam, preventing incoming and outgoing texts and calls, and even accessing private data like usernames, passwords, and net banking information.

In addition to the tools for removing bots, the CSK portal also provides other security programmes like "USB Pratirodh" and "AppSamvid." To improve their security, users have the choice to download these programmes.

A desktop programme called "USB Pratirodh" is intended to control how detachable storage devices, such as phones and pen drives, are used. Users must enter a username and password each time a new USB device is attached in order to be authenticated. This programme also encrypts data, changes read/write permissions, and analyses USB drives for viruses. AppSamvid' is a programme for Windows users that restricts the operating system to only running authorised files. It enables users to make trustworthy Java files and executables lists. The software can also be password-protected by users. 'AppSamvid' guards the computer against malware such as viruses and trojans.

Instagram allows downloading Reels

Instagram Reels download option is finally available but

the company is going for a phased release meaning not every market has access to it yet. However, you may still want to know how to use it. Here's how it works. Adam Mosseri announced the new Instagram feature via his broadcast channel. You will get a download button, clicking which the reel gets saved in your camera roll/gallery.

Realme turns off the controversial setting after push-back from the govt

Realme India has

pushed an update to Realme UI 4.0 that disables the contentious 'Enhanced Intelligent Services' setting by default. This cuts the automatic permission and the subsequent process of data collection and mining. Well, at least the concern Realme users have for the use of their data. Following the backlash from the public and even a warning from the Indian government, Realme has rolled out an update dubbed RMX3741_13.1.0.524 (EX01). It's a small update as the file size is just 20.93 MB.

JioTag takes on Apple Airtag

Apple AirTag might just have a new competitor in the market. Jio has

introduced the JioTag which is not only an alternative but also a much cheaper option. The JioTag has been listed on Jio's official website and has revealed all the details for the same. JioTag is Bluetooth enabled and works in a range of up to 20 metres indoors and 50 metres outdoors. JioTag can be used to track down lost or misplaced items like keys, wallets and so on.
