

# MSI Titan GT77 HX 13VI

Head-turning specs and awe-inspiring performance

₹4,90,103

E

ver since we were kids, many of us dreamed of

taking our gaming desktops on the road to enjoy our favorite games anywhere. With the advent of gaming laptops, that dream is now closer to reality. However, portability often requires a trade-off in terms of power, resulting in laptops that typically lag behind their desktop counterparts.

The interesting part about performance, though, is that it has a defined threshold. For instance, if your laptop can smoothly run games at 4K 60FPS, you probably don't need much more firepower. This is what makes today's review subject, the MSI Titan GT77, so noteworthy. It's recognized for its outstanding performance and at the time of writing this article, it's arguably the world's most powerful gaming laptop. The Titan GT77, fortified with the 13th Gen Intel chip, aims to pack desktop-grade power into a laptop's body.

## DESIGN AND BUILD

The MSI Titan GT77 combines a strong and powerful design, mirroring its high-performance capabilities. Despite its weight of 3.30kg, it feels sturdy and built to last. The laptop sports a black exterior with various design elements and RGB

lighting, adding a touch of gamer aesthetic. Users can customize or turn off the RGB lighting using the Steelseries GG app for a personalized experience.

Despite its size, the Titan GT77 features a large 17.3-inch screen packed into a relatively small frame for such a high-powered gaming laptop. MSI's experience in hardware production is evident in the laptop's superior build quality, making the Titan GT77 feel durable and reliable.

## DISPLAY

The laptop's 17.3-inch screen is impressive, boasting a 4K (3840x2160) resolution with an IPS panel. The thin bezels around the display enhance the viewing experience, and the HDR 1000-sup-

ported panel provides bright, vibrant colors. Brightness tests show the display peaks at 832nits, and color accuracy is high with 99.4% sRGB, 84.2% Adobe RGB, and 95.1% DCI-P3 coverage. The MSI Titan GT77 delivers great visuals for gaming or multimedia creation.

Mini LED displays use minuscule LEDs for precise backlighting, enhancing image quality. They deliver high contrast ratios, vibrant colors, and deep blacks akin to OLED displays, but without burn-in risks. Offering higher brightness and superior local dimming, Mini LEDs are excellent for displaying HDR content, creating an immersive viewing experience.

## PERFORMANCE

MSI Titan GT77 sports cutting-edge components, the Intel Core i9-13950HX processor (24 cores) with a max turbo frequency of 5.5GHz, and Nvidia's RTX 4090 mobile GPU. It is complemented by 64GB DDR5 RAM and a 4TB SSD, making it a behemoth in terms of tech specs.

Moving to benchmark tests, the Titan sets the bar high, with a PCMark 10 score of 11752 - the best we've ever recorded for a laptop. Even in Cinebench R23, the Titan delivered an unbeatable multicore score of 28289. However, focusing only on the processor doesn't do justice to the Titan GT77, as its Nvidia RTX 4090 mobile GPU, with 16GB GDDR6 memory, is equally powerful.

The new RTX 4090 mobile GPU establishes its supremacy with a phenomenal Time Spy score of 19396, leaving competitors like the RTX 3080 Ti in the dust. The RTX 4090 also performed splendidly in gaming benchmarks, displaying a significant lead in Shadow of the Tomb Raider and setting an unprecedented average score in Metro Exodus. For a more challenging test, I fired up AC Valhalla at 4K resolution and ultra details. The Titan still delivered an impressive 79 FPS. Its ability to deliver such performance even with demanding titles proves its potential for future games, especially as ray tracing and 4k gaming gain popularity.

## BATTERY AND MOBILITY
