

NU TV 4K 65 Smart TV (LED65UWA1)

Great value for money!

₹46,990

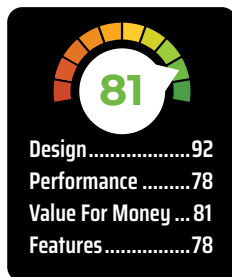

The last 24 months have seen a lot of movement within the smart televisions space. New players have thrown their hats into the ring in a bid to capture this growing market. One such player is NU, which recently launched new smart TVs in the Indian market across multiple sizes and budget segments.

Arguably the most interesting of its TVs line-up is the 4K 65-inch smart TV, that in our opinion offers very good value for the Rs 49,990 price tag slapped on it. From its impressive build quality to its good picture performance and support for some interesting features, there are multiple reasons why this TV is the value-for-money king in the 65-inch 4K TVs segment. Read our review for an in-depth take on all of them.

PICTURE PERFORMANCE

Let's dive right into what's arguably the

most important factor in making a TV buying decision: the picture performance!

The NU 65-inch 4K TV offers brilliant picture performance for the price. In fact, as we found in our display tests, it managed to punch above its weight, not only managing to hit similar numbers in crucial

tests as more expensive TVs from the likes of Sony and OnePlus but also surpassing them. For example, in the Calman Ultimate's Color Checker test, the Spectral C6 Colourmeter recorded some really good numbers on the TV. Clocking an average DeltaE of just 2.2 and a max variance of 5.9 at Point 2G – shade of blue – the NU 65-inch 4K TV easily surpassed the testing results of far more expensive TVs such as the Sony X75K.

Gamma tracking on the TV was also good and along with it also the RGB balance, with reds and greens, staying very much in check, and some over tracking on the blues. However, the TV maintains a good balance for these colours and the average correlated colour temperature also

remains very close to the D65 point. The panel also covered almost the entire container of the sRGB colour space. While the numbers were good, the gamut coverage number at 95 per cent was nothing to get too excited about. This was also the case for the peak brightness of the panel, which remained stable at 332 nits. To the TV's credit, this number was higher than we've seen on competing LED backlighting TVs such as the Sony X75K, OnePlus U1 and the Micromax Matrix QLED.

In our opinion, much of this is because the TV brings with it some really well-tuned colour presets, with the Cinema preset generally giving very good results not only in benchmark testing but also in real-world usage -- especially while watching movies and shows on the TV.

For HDR content, the TV again performs well. However, it does have some limitations, like the lack of Dolby Vision, that need to be mentioned. Although, it'll only be fair to mention that Dolby Vision is a standard that despite being supported on a lot of 4K TVs these days, is not something that you should be basing your buying decision on, because it's still a standard that remains unavailable from the entire line-up of TVs from many brands like Samsung. To compensate for the lack of Dolby Vision, we do get support for HDR10+ on the TV, which does a good enough job of handling content that's mastered to take advantage of it.

The dark scene performance of the TV is also good, with very little blooming effect. Blacks look closer to black, and no noticeable grey tinge is noticed in such scenes, which again is impressive for a TV in this budget segment. Apart from this, we also get decent content upscaling on the TV, however, it's not on the same level as we've seen on TV from more premium brands.

Overall, the picture performance is quite good, with the NU 65-inch 4K TV adopting a mature approach, and instead of going down the path of oversaturated visuals, choosing well-balanced colours to reproduce scenes on the TV, which in my opinion makes the experience of watching movies, shows and even live sports on the
