A soundbar that can be carried around at ₹ 1,799. Sounds interesting, right? Well to find out where the Crossbeats Blaze stands, I took it out for a spin and here's what I found out when using it –

Build and Design

With the Crossbeats Blaze, you get a soundbar that is built well for the

price. The plastic body complimented with the metallic front grill, makes for a solid package for the money you are shelling out on the soundbar. There are some basic play/pause and mode controls on the top of the bar, with the front sporting a nifty little display. On top of the bar you get two woofer membranes that are exposed, and light up when you are playing music, which I think is a nice addition to ensure that you have the mood set right when you are enjoying your favourite tunes.

As for the back of the bar, you have three input ports, a USB-A port, a micro-SD card slot, and a 3.5 mm audio jack. There's an on-and-off toggle switch and a USB-C port to charge it up. The base of the soundbar has two textured rubber feet, which are meant to ensure that the bar is in place and does not rattle around when you are playing music. They worked well for the most

part, but at max volume, when I played some bass-heavy tunes, the experience was not the best as there was some rattling which I saw seeping through. The bar overall has a nice heft to it, which gives it a nice feel when you are moving it around. The size is considerably smaller than many other soundbars out there, which is also nice to see. Being a budget offering, Crossbeats has cut some corners, but not in places where they become a pain point when you are using the bar. For the price, there are only a few other soundbars which I'd say match up to this. Now, let's move on to the features of the Crossbeats Blaze.

Features and Battery life

When talking about features, the Crossbeats Blaze is not the most feature-rich device out there. The feature set is limited, but in my experience, it is well implemented. Let's start with the first of the lot, which is TWS pairing mode.

If you have read up on Bluetooth speakers and similar devices, then you'd know that this feature allows for two devices of the same kind to be paired together and play music simultaneously, making a TWS stereo setup.

Brands like JBL, LG, and others have been doing a great job at implementing this feature. And, given the volumes that these brands sell, the chances of you encountering a friend
