

who owns a device which you can daisy chain with yours are really high. Now, if same is the case with Crossbeats' Blaze soundbar, then you will find yourself having a stereo setup using this feature.

While I did not get a chance to experience this during my time of use, as I had only one unit of the soundbar, it is pretty easy to implement, and I am sure Crossbeats would have done well when including this on the bar.

Then come the customisable RGB LED lights on the woofer membranes of the bar. I did play around with this during the time I spent with the bar, and apart from a couple of hiccups here and there, the feature worked well for the most part.

Given that this is a portable soundbar, it comes with a 1200mAh battery. Crossbeats claims that the battery on this bar is supposed to last up to 8 hours. I was able to get close to 7 hours of playback at 50 per cent volume, which is respectable for a product like this. And, when you are out of battery, you can plug in a USB-C charger and juice it up.

Performance

Crossbeats promises that you can feel the home theatre experience with this soundbar. But, in my time with the Crossbeats Blaze, I found it lacking on that front. The loudness of the bar is enough to fill a small to medium-sized room but not a larger one. The 24 W Dynamic speakers, when you play them head on give a decent listening experience, but when you move away, the quality takes a massive plunge.

Now, I am being picky here, having tested speaker systems that cost about 15 times more than this bar. But I honestly expected a much fuller sound from this device. When listening to vocal-heavy tracks or radio, which is also present on the bar, the experience was awesome. The mids and highs on this bar are crisp when you consider that it is priced under ₹2,000. So, if you are someone who listens to a lot of podcasts as well then you will be pleased with

the sound that this bar has to offer. But, when I was listening to Bollywood, pop, or hip-hop tracks, the bar sounded kinda hollow. This especially stands out after the fact that the brand heavily advertises the 43 mm dual bass membranes that are located on top of the bar. Things get really tricky here, especially after we consider the fact that brands selling products at this price point tend to have a much more bass-heavy sound signature out of the box.

But when you factor in the price and look at what you can get for the same price in the same category, things make sense. The sound is serviceable for the most part, and what you are getting here in terms of pure performance, is decent value for the money you are spending on this bar.

The final word

The Crossbeats Blaze is a nice attempt by a relatively newer brand at making a product that is trying to make a space of its own in a highly competitive space. Brands like MiVi, boAt, and F&D have been dominant in this space and the entry of Crossbeats with their Blaze soundbar seems to be the factor that would tip the scales.

The soundbar itself I would say is ideal for use on your desktop setup for casual content consumption and some gaming. Gaming I say is because the bar has an AUX port, which when used would eliminate the problem of lag which could creep in when you are connected via Bluetooth. And, if you are fan of old-school media, then the FM radio is something that you'd love. **d**
