

HP E45C G5

I am throwing away my monitors!

Yetnesh Dubey | yetnesh@digit.in

Modern workspaces are often cramped with monitors. Doesn't matter if you're a coder, a journalist, a stock trader, or a gamer, everyone is rocking multiple displays at their desk. And while a multi-monitor offers a healthy boost to your productivity, it can soon become tedious to manage the increased number of HDMI and adaptor wires. And if you're using multiple monitors then getting a seamless experience between the two screens can also be a challenge.

But HP has one monitor that aims to solve all these problems. No, let me rephrase that, HP has a really big monitor that can easily solve all these problems. I have been using it for over a month now and I have much to say about it. Starting with

its name, this immense monitor is called the HP e45c G5. It is a 45-inch curved monitor which is equivalent to housing two 24-inch Quad HD displays in a single unit. As a result, it has a ridiculous 32:9 aspect ratio. For reference, a normal monitor's aspect ratio is 16:9.

An ultrawide display has a 21:9 aspect ratio. And the one that I have is superwide, thanks to its 32:9 ratio. So in this article, I am trying to answer what features this monitor brings to the table and how can it be used to fit into your daily workflow.

Price and Features

Available at a starting price of Rs 1.26 lakh, the HP e45c G5 superwide monitor is definitely a niche product. But don't get me wrong, niche

products are actually quite good, to be honest, they're the best. Just look at the Sony XPERIA 1 Mark V, a \$1400 smartphone with exceptional cameras. While niche products give more control in the user's hands they often make controlling the said device complicated. But I am happy to say that the HP Superwide monitor succeeds there.

Additionally, this monitor offers intriguing modes, enabling you to connect two PCs or use it as two separate displays. The HP e45c G5 is a premium product, primarily marketed as a business-oriented device. It's really useful for people using two displays or those who need a lot of screen real estate. While it can work as a gaming monitor, I think it is targeted towards business and creative users. Primarily because the device has a 3ms response time while most high-end gaming monitors have 0.5ms screen response time.

The HP e45c G5 monitor has a maximum resolution support of 5120 X 1440 resolution. So it is basically two 1440p displays side by side. In terms of specs, It has 400
