

AMD and Acer on their collaboration to bring the latest Ryzen 7000 processors on Acer laptops

With the latest wave of demand for on the go power houses, AMD is making moves and Acer is tagging along! The future looks interesting for sure...

Mithun Mohandas
mithun@digit.in

In this exclusive interview, we had the pleasure of sitting down with representatives from both AMD and Acer to discuss the latest in processor and graphics technology and how those cutting edge technologies are being brought to market by major OEMs. AMD has recently launched their Ryzen 7000 series processors, and Acer, a leading laptop manufacturer, is among the first to incorporate these powerful chips into their products. We delve into the specifics of AMD's innovative processors, the collaborative efforts between both companies, and

AMD India

how Acer's latest laptops are benefiting from this partnership. Read on to discover what lies behind the technological breakthroughs and learn about the exciting possibilities that these innovations bring to the world of laptops and beyond.

📌 The Ryzen 6000 (Zen3+) series was all about bringing the capabilities of the Zen 3 5000 series into a more portable form factor. What are the design goals with Zen4-based laptops?

📌 Zen 3+ allowed us to deliver ultrathin performance leadership last year. With Zen 4, we aim to help create designs that are even lighter and more power efficient, while delivering better performance and enabling new experiences with features like Ryzen AI. To that end, we've designed the Ryzen 7000 series mobile platform to be one of our most flexible and scalable designs yet. On one end we have the AMD Ryzen 7045 series, which we believe to be the world's most powerful mobile processor thanks to its 5 nm node, 16 multi-threaded cores, 5.4 GHz boost clock, and that huge 80 MB of cache (L2 + L3). Then we have the AMD Ryzen 7040 (Phoenix) featuring the world's first integrated AI Engine. That engine is based on our XDNA architecture and we're very excited about the capabilities and efficiencies it unlocks in the laptop form factor. Phoenix is also built on a cutting-edge 4 nm node, and features powerful RDNA3 graphics, making it a true flagship. The Ryzen 7020, 7030 and 7035 series offer proven performance and longer battery life for more value conscious buyers. Paired with RDNA2 and Vega graphics, we're also in a unique position to be able to offer esports-ready gaming performance in this category and price.

📌 Could you elaborate on how the AI Engine built into the Ryzen 7040 series chips will benefit the users?

📌 The computing experiences of today
