

are increasingly being driven by AI. We've seen some truly transformative AI experiences emerge this past year. Models like stable diffusion and ChatGPT have changed our perceptions of what computers can do, and engineers everywhere are increasingly designing their apps around AI. We've seen this in productivity apps like Teams and Zoom where AI is used to remove background blur and noise in audio, image editing apps like Photo-shop and Lightroom for neural filters and subject detection, AI-powered suggestions in apps like Notion, and more. Given the power of modern CPUs and GPUs, these models do run on current laptop hardware, but they do so very inefficiently. Your components have to run faster and hotter to perform AI-driven tasks that we take for granted today, making it harder to make thermally efficient designs that also deliver on promises like all-day battery life. The XDNA-based AI Engine we've integrated into Ryzen 7040 is designed specifically to more efficiently handle such workloads. Not only does it accelerate AI experiences, but it also does so at much lower cost. As the adoption of AI engines increases, the benefits of an integrated AI Engine will only become more prominent.

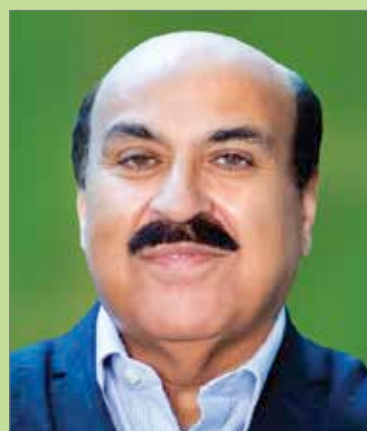

Q We didn't see a lot of AMD Ryzen 6000-based laptops in the Indian market even months after launch. What efforts is AMD taking to ensure wider availability of AMD Zen4 based 7000 series laptops in India?

A We won't be able to answer the first part of this question. The scalability of the AMD Ryzen 7000 series mobile platform allows OEMs the flexibility to design new categories of products, and at price points that consumers are comfortable with. We're also working closely with them to help improve sales by offering training and education programs for partners, and engaging in joint marketing and promotional activities to help raise awareness for the platform. 

Q Please tell us what are the key factors driving the demand for Acer's laptop business in India?

A The PC market grew exponentially as work-from-home became the norm during the pandemic, and it's now more common to see PCs as personal devices rather than the family computer. In fact, it's now more common for people to seek laptops that fit their lifestyle, not just their work. On the gaming side of things, the rise of eSports as a viable profession is certainly an encouraging sign, and it's one of the reasons we're increasing our investments in the gaming laptop and accessory market. We're also ensuring that the latest products arrive in India at the same time as they do globally.

We still think there's a lot of scope for growth in the India PC market, and we're seeing demand from all sectors including SMB, govt., BFSI, and more.

Harish Kohli
President & Managing Director,
Acer

Q We know gaming has been a focus area for Acer. How is Acer planning to strengthen its leadership with the latest partnership with AMD for the Ryzen 7000 series?

A I think it's safe to say that Acer has a history of innovation and a reputation for incorporating cutting-edge tech into its products. With AMD, we're better able to deliver on our promises of multi-tasking performance for work, single-threaded performance for gaming, and that all-day battery life that both gamers and professionals desire. Thanks to AMD, we're able to offer powerful and sophisticated solutions to all our customers, and with Ryzen 7000, we're proud of being among the first in India to do so. It's encouraging to see the response that AMD's products have received so far. AMD's Ryzen PRO 6000 series has allowed us to offer more secure, and easy-to-manage devices to enterprise clients, which has led to more growth in that sector as well. We're excited to be able to collaborate with AMD and offer such cutting-edge solutions to our customers.

Q Which are the new AMD-powered models you will be launching and what are the expected timelines?

A The Aspire 3 we just launched is the first AMD Ryzen 7000 Mobile Platform powered device in India, and it offers a great mix of thin-n-light performance and affordable pricing. It represents great value, and looking at the positive feedback it received, we decided to release the sleek and metallic, Ryzen 7000-series powered Swift Go as well - a productivity powerhouse. In addition, we'll soon introduce the Nitro 5 to gamers - a laptop that can handle 4K video editing, HDR streaming, not to mention high-performance gaming, and all at a very reasonable price. We will also be releasing devices to address other market segments soon. Our partnership with AMD enables us to offer class-leading technology and a pleasant computing experience to our customers. 2022 was a milestone year for us, and we believe that 2023 will be even better thanks to partners like AMD.
