

■ WHATSAPP

WhatsApp now lets you send instant video messages

Mark Zuckerberg, CEO of Meta, has made an exciting announcement regarding an upcoming update on WhatsApp. This latest update will introduce a new feature for WhatsApp users to share short, personal videos directly

within their chats. Drawing parallels to the popularity of audio messages, the video messages come with some unique upgrades.

The instant video messages on WhatsApp enable users to respond to chats in real time using up to 60 seconds of recorded video content, just like voice message feature. It can be utilized for various purposes such as conveying birthday wishes, sharing laughter over jokes, or delivering heartening news to friends and family. WhatsApp has presented several interesting use cases for this feature, addressing any potential queries about its practicality. <https://bit.ly/454Kk3q>

■ APPLE IOS

An iOS browser with Chrome Extensions and Firefox Add-ons?

No, it is not Safari. Although it is the de facto browser on an iPhone, iOS users can switch to other mobile browsers on App Store. However, most iOS browsers are very similar to each other, unlike their desktop counterparts.

This is partly because Apple mandates all browsers on the platform to be on Webkit, which is the Safari web engine. This makes the iOS browser market very homogeneous. They lack the versatility and extension support of many desktop browsers.

Safari has very limited extension support and if you want something more, you should check out the Orion browser. Note, not all extensions work at the moment. Like we tried Ublock Origin and Return YouTube Dislike and they weren't working. Meanwhile, Momentum and Dark Reader seem to be working fine. <https://bit.ly/30h06j4>

Netflix introduces a dedicated tab that shows what you may want to watch

Netflix's new My Netflix tab uses personalized algorithms to show you content that you may want to watch based on your past likes, watch history, app usage, trailers you have watched, etc. As per the official announcement, the feature will be available on both Android and iOS, but the former will get it in August. Do ensure to update Netflix from the respective app stores.

Android's new Unknown Trackers Alert lets you block stalkers using AirTag

Scared of someone tracking you with an AirTag? Yes, AirTag, a device by Apple that was created to help users find a lost item and have peace of mind. However, in the hands of bad actors, it could and has become a cause of concern. There have been several reports about this. While Apple did come up with built-in features on iOS for alerting you of unknown trackers following you, Android didn't have anything until now.

Samsung Wallet is one app to store all your IDs and money

Earlier this year Samsung Pay became Samsung Wallet. This rebranding broadened the scope of this app. It was more than a mobile payment and digital wallet app. You could now not only store credit/debit cards and digital currency, but login passwords, DigiLocker IDs, and health/vaccine certificates also. In today's announcement, Samsung reveals its Wallet app now also gets the option to store digital IDs.
