

Razer Blade 14

Small body, big power

₹2,22,780
(approx)

In this review we're going to be taking a look at the 2023 variant of the Razer Blade 14. While there was no significant upgrade between the 2021 and 2022 variant of the Razer Blade 14, the 2023 variant sees some major changes, both with the hardware and the externals of the laptop.

The unit we recieved came with the new 7000 series AMD Ryzen 9 7940Hs processor, paired with the NVIDIA RTX 4070. Other than that, it came with 16GB of DDR5-5600 RAM, 1 TB of SSD storage, and a 14-inch 2560 x 1600 resolution, 240 Hz IPS panel. We should point out that this laptop is not officially available in India, but if you are planning to pick the laptop up abroad, it will set you back by USD 2,699. Definitely not cheap, but as you can see from the specs, it certainly packs a punch, at least on paper.

Let's dive into the full review to see just how well the new 7000 series Ryzen 9 and the RTX 4070 perform.

BUILD AND DESIGN

I personally have not tested the previous model of the Razer Blade 14, however, a cursory glance will tell you that they look pretty similar, at least on the outside.

The new Razer Blade 14 uses the same aluminium body as last year's model with similar branding. The overall look and feel of the laptop remains the same; you know that this is a Razer Blade laptop without a doubt. The laptop features excellent build quality, it felt very sturdy and reliable in our hands. The base is strong with little to no flex upon application of pressure, and even the laptop lid and hinge feel extremely reliable with barely any flex or wobble in the hinge.

With the display now being 16:10 instead of 16:9 from the previous Razer Blade 14, the laptop is slightly larger to accomodate the extra screen space. As such, we see that even the touchpad on the new Razer Blade 14 is slightly larger than last year's model. Another new thing Razer has incorporated in the Razer Blade 14 starting from this year is a webcam shutter slide and removable RAM modules. This is fantastic from a consumer's point of view, and while the Razer Blade 14 ends up being around 1mm thicker than last year's variant, it's a minor sacrifice.

I/O

With this being a 14-inch laptop, ports are understandably limited. There are no ports on the front or back of the machine. On both the left and right side you have a single USB-A and USB-C 3.2 Gen. 2 port for a total of two each. On the right side you have an HDMI 2.1 port and a kensington lock and on the left side, you have the AC adapter port, and the combo audio.

DISPLAY

The display on the Razer Blade 14 is great. The 16:10 240 Hz IPS panel offers high peak brightness. We tested 552 NITS average peak brightness during our display test. It's also very colour accurate making it excellent for your content creation needs on the go. We tested an sRGB coverage of 99.6 percent and a DCI-P3 coverage of 98.3 percent. The only drawback we would say is that it's not an OLED panel, which honestly isn't all that much of a drawback.

PERFORMANCE

With that, we come to the performance on the Razer Blade 14 2023. Quickly going through the specs once again, the new Razer Blade 14 comes with the new 7000 series AMD Ryzen 9 7940Hs processor with a base TDP of 35W, which is paired with the NVIDIA RTX 4070 with a TGP of 140W. For this review, we'll be comparing it with the HP OMEN Transcend 16, which also features an RTX 4070 (with a TGP of 130W), and an
