

Sony A80L 65 inch Smart OLED Google TV (XR-65A80L)

Premium OLED TV in a competitive market

₹2,84,990

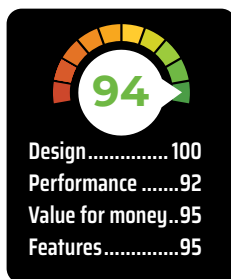

The Sony Bravia A80L is a premium OLED

TV that boasts a range of Sony's proprietary image and video processing technologies, enhancing the cinematic experience. This television excels in handling legacy SD content and motion, ensuring amazing performance. Moreover, the HDR10 and Dolby Vision experiences are also mostly impressive, though we noticed that highlights don't get bright enough to pop. Acoustic Surface Audio+ technology adds realism and further elevates the overall viewing experience.

DESIGN, REMOTE AND SOFTWARE

Sony continues to follow its minimalist design approach, and the A80L is a sleek and stylish TV that also feels solidly built and extremely premium. The aluminium slim-wedged stand of the TV can be

mounted in three positions, with each successive angled-in position raising the TV a bit higher. With the feet set straight, the TV can accommodate most conventional soundbars at the front without blocking the display view.

The power cord is detachable and should be easy to replace. All ports are placed toward one side. The HDMI ports are properly spaced, and of these, HDMI 3 and HDMI 4 are full bandwidth HDMI 2.1 ports (HDMI 3 supporting eARC). HDMI 1 and HDMI 2 are based on HDMI 2.0. There are two USB-A ports on the rear positioned back to back, so it might be a tad inconvenient if, for some reason, you need to use both simultaneously.

The remote is quite ergonomic and has 6 hotkeys for popular apps. The buttons are sensibly laid out, and we got used to the layout in no time. However, they are not backlit, and we wouldn't be fussing about

this if we hadn't experienced the luxury with the Sony Bravia A95K.

The Google TV interface on the Sony Bravia A80L ran perfectly smoothly during our testing. The TV further integrates Google Assistant, Chromecast Built-in, Apple AirPlay, and HomeKit, so you will be able to easily cast from all popular mobile devices.

PICTURE QUALITY

To start with, the Sony Bravia A80L uses the WBE OLED panel (WRGB) sourced from LG displays without any heat sink. While this is a good quality OLED panel supported by Sony's deft image processing algorithms, it must be mentioned that the panel falls below the QD-OLED panel that Sony uses on the A95K or the latest MLA OLEDs available in this year's LG G3, both of which can achieve significantly higher brightness.

If this is your first experience with an OLED TV, the Sony Bravia A80L will definitely wow you. The deep blacks, high contrast, wide viewing angles, and fast response times are advantages that make watching good-quality OTT content truly amazing. Sony TVs are also renowned for their expertise in upscaling low-quality content, smoothing gradations, and handling motion in a balanced manner.

The Sony Bravia A80L does not include a Filmmaker mode to accurately reproduce the creator's intent. The most colour-accurate profile on the TV is Custom, but most people will understandably use Standard, Vivid, and Cinema modes that enhance colours and contrast to make the content look pleasant.

Since the Custom mode is the closest to a colour-accurate profile, that is what we tested using the Spectral C6 colourimeter and Portrait Display's Calman Ultimate software. Sony has a number of custom settings enabled by default, and we disabled power-saving and light sensor adjustments before our testing.

In SDR, the greyscale has a significant blue bias, thus impacting white-point accuracy. As you can see, the gamma over tracks the standard in the shadow region, resulting in some compromise in shadow details.
