

OPPO Reno10 Pro+ 5G

Impressive portrait camera, but is that enough?

Touted to be the new “Portrait Expert” on the block, the OPPO Reno10 Pro+ 5G has finally launched in India to much fanfare. This is the first Reno series phone we’re seeing from OPPO after a brief hiatus. So, naturally, I was excited to try out the Reno10 Pro+ to see how much of an improvement it is compared to the Reno8 Pro (which we reviewed) and how it stacks up against competitors. Let’s find out!

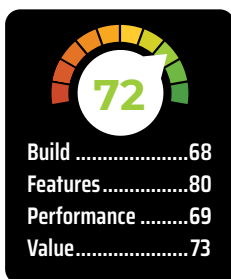

BUILD AND DESIGN

The OPPO Reno10 Pro+ has a new pill-shaped camera module; a massive design departure compared to the Reno8 and Reno9 series. The new camera module looks striking. The camera uses the same MariSilicon X chip as the Find X series. The rear panel, however, is quite the fingerprint magnet; racking up substantial marks within seconds. The impression you get so far is that this is a premium device, but that image shatters when you find out that OPPO has used a plastic frame for the phone, which is not really acceptable at this price.

The display is a beauty to look at with minimal bezels that are quite uniform. There’s an in-display optical fingerprint sensor that worked perfectly during our testing. The phone is not IP rated and it comes with AGC Dragontrail Star 2 glass as protection for the display.

For a high-end device, OPPO has managed to keep it quite lightweight and slim making holding it extremely comfortable but the device is ridiculously slippery, so use it with a case which comes with the phone.

DISPLAY AND SOUND

The OPPO Reno10 Pro+ impresses with its immersive screen. There’s ProXDR support that bumps up the contrast and dynamic range of HDR photos viewed on the Reno10 Pro+ that

make them look even more spectacular. The display also supports 120 Hz refresh rate with an option for Dynamic refresh rate. All good things, but when I select High refresh rate (120 Hz), apps such as Instagram and Twitter still default to 90 Hz. Why OPPO, why? That aside, the display looks beautiful, HDR content looks stunning with decent detail and great colour. The viewing angles are fantastic and the display is bright enough to be legible even in bright sunlight. In my testing, I got a peak brightness reading of 992 nits, which is close enough. The display’s incredible 90.6 per cent screen-to-body ratio makes the content look even more immer-

sive. The addition of Dual Track stereo speakers – one at the bottom and one at the top, makes for an upgraded content consumption experience.

CAMERA

The primary 50 MP camera is capable of clicking some good shots with saturated colours and great detail. However, the dynamic range is not the best in the business. Highlights can get overblown at times, and we’ve seen some object haloing happen in tricky lighting situations. OPPO tries to retain detail in the shadows in most pictures, but the algorithm tends to mess up the highlights in the process. The telephoto periscope lens is where all the magic happens. The 3x magnification level especially coughs up some stellar results with great detail retention, decent colours, and good dynamic range. The bokeh looks superb and you can adjust it to your liking after clicking the picture as well. The telephoto lens even delivers awesome portrait results on inanimate objects. Sadly, it is not all perfect. The telephoto lens makes some subjects’ skin tone lighter than it is. Additionally, the edge detection is not top-tier level. If OPPO manages to fix these issues via a software update, this can easily be one of the “Portrait Experts” that even competes with ₹80K-1-lakh+ phones that are marked as flashships!

Now, the portrait lens also offers 6x in-sensor lossless zoom and the quality this offers despite not actually being a 100 per cent optical zoom is incredible. Crisp details, great colours, and fantastic bokeh blur is what you get at even 6x zoom levels! The 8 MP ultrawide is decent, no doubt, but the images are noticeably softer, distorted around the edges, and lack good dynamic range. We also tried our hand with low-light photography, and as expected, the ultrawide lens was the weakest link with soft, grainy results. The 50 MP primary lens manages to capture good detail in Night Mode with very little noise. Portrait 3x
