

shots, however, are inconsistent. Do note that in low light conditions, the telephoto lens is disabled and instead, the primary camera digitally crops to 3x or 6x shots. So, look at the difference between these two portrait shots taken in low light, one after another. The lens can't seem to figure out the exposure right. Also, it gets the edge detection very wrong in low-light, at times. Lastly, let's delve into the 32 MP selfie camera. This is actually my second favourite lens on the OPPO Reno10 Pro+ after the periscope telephoto lens.

I was impressed with the level of detail in selfies and how OPPO actually stayed true to the skin tones of individuals. The dynamic range is also impressive! Portrait selfies, however, while being crisp and detailed, have mediocre edge detection. Video recording tops at 4K at 60 fps and the footage is decent, nothing revolutionary. Selfie video is capped at 1080p.

PERFORMANCE

The OPPO Reno10 Pro+ is not the best performer in its price category. In fact, the iQOO Neo 7 Pro that costs just ₹34,999 - that's ₹20K cheaper - outperforms the Reno10 Pro+ in almost every benchmark.

In AnTuTu and GeekBench, the iQOO 11 and iQOO Neo 7 Pro outperform the Reno10 Pro+ but the Pixel 7 lags behind. Interestingly, the iQOO Neo 7 Pro which is powered by the same chipset as the Reno10 Pro+ performs considerably better in these two benchmarks. This could be because OPPO is throttling the performance to some extent to boost device longevity and reduce heat.

We ran the CPU Throttling Test to check this, and in less than 20 minutes, the OPPO Reno10 Pro+ had already throttled to 78 per cent of its peak performance. The phone doesn't heat too much though, possibly due to the upgraded cooling system.

In PCMark Work, the Reno10 Pro+ puts up a valiant effort beating

out every phone but the iQOO 11, which means it will serve you well for productivity tasks such as working on excel sheets, editing photos, and more. In GPU benchmarks, the OPPO Reno10 Pro+ performs decently, beating out the iQOO Neo 7 Pro but falling behind the Snapdragon 8 Gen 2-powered iQOO 11.

In GFXBench, both the iQOO Neo 7 Pro and the iQOO 11 are significantly ahead. In real-life, you're not going to see any considerable stutters or hitches in daily use. The OPPO Reno10 Pro+ ships with ColorOS 13.1 out of the box based and the UI, as we've seen on other OPPO phones, is feature-rich; packed with customisability. However, the bloatware is so rife that we were dissuaded from the fact that this is a high-end, near flagship phone.

BATTERY LIFE

The OPPO Reno10 Pro+ houses a 4,700 mAh battery to keep the lights on. While on-screen time was pretty decent in my testing, the phone leached quite a bit of battery on standby. Going from 80 per cent at 8 PM at night to 2 per cent at 10 AM in the morning. In my 4K video loop test, the phone lasted a decent 14 hours and 12 minutes, which is not bad. The battery life is decent enough to last most users an entire day, but this is a phone you'd have to charge every night. Additionally, if you're a heavy user, you may find yourself reaching for the charger at 6-7 PM in the evening.

Either way, the battery life is not appalling but it's not the best either. However, the 100 W SUPERVOOC fast charging support kind of makes up for it. The phone goes from 0-100 in just 29 minutes, according to my tests. Furthermore, a mere 5 minute charge top you up to around 20 percent or even more, which is impressive. Sadly, there's no wireless charging, even though the back panel is glass.

VERDICT

OPPO made some tall claims with

the OPPO Reno10 Pro+; the loftiest of which is being the "Portrait Expert". I think they've actually nailed it to some extent. The telephoto periscope lens on the OPPO Reno10 Pro+ clicks some of the most stunning portraits I've ever seen. Especially at under ₹60K.

The natural bokeh and crisp details make for some social-media-worthy shots, however, the camera system is not perfect. The portrait lens could use some tuning when it comes to skin tone colour and edge detection. Similarly, the primary lens could use some work on dynamic range; and the ultrawide camera needs a complete overhaul. However, it is a valiant attempt from the company. OPPO has truly managed to deliver a competitive portrait experience for a fraction of the price of competing flagship phones.

That aside, I think there are some other areas where the OPPO Reno10 Pro+ could really improve. Some examples are the plastic frame at ₹55K, inconsistencies in the refresh rate settings, and the bloatware-ridden ColorOS. Additionally, for gamers, this is not the most powerful offering at this price and for 15-20K cheaper, you can get phones that sport the same SoC. Personally, I cannot wait for the OPPO Reno11 series. I hope the company takes what's bad and makes it better, but more importantly, takes what's good and makes it spectacular.
