

MSI Cyborg 15

RTX 4050 for under Rs 1 lac

₹99,990

The MSI Cyborg was first revealed during CES 2023, and it's cool cyberpunk design and the specs on board were certainly pretty appealing, however what was even more appealing was the fact that you could get all of that for just Rs 99,990, at least as of writing this review. We're talking a 12th gen Intel Core i7 paired with the new 40 series NVIDIA RTX 4050 Laptop GPU. There's also a 13th gen variant that isn't available in India yet.

BUILD AND DESIGN

Let's start things off with the build and design. The MSI Cyborg 15 immediately distinguishes itself from other gaming laptops with its rather unique looks. The sides, the lip and the base of the laptop are all translucent. This gives the laptop that cyberpunk look we were talking about

earlier, but at the same time, it's not so flashy that it might draw attention in public. The same translucent design is present on the WASD keys as well.

Unsurprisingly, the laptop features a plastic chassis. This is fairly common with budget laptops, but you do still get an aluminium metal lid. The laptop feels pretty sturdy overall, and even the hinge didn't give us too much flex. Most of the laptop features a matte black finish.

The laptop features a backlit keyboard, with no RGB. Which we didn't really mind at all. We found the keys to be well-spaced and the overall typing and gaming experience was pleasant. The touchpad doesn't get in the way of typing.

DISPLAY

The MSI Cyborg 15 comes with a 15.6-

inch 144Hz FHD IPS display. As far as displays are concerned, it's pretty decent. During our testing, we got a peak average brightness of 307 nits, an sRGB coverage of 65.9 per cent, and we tested 48.7 per cent DCI-P3 coverage overall.

All in all, we'd say the display on the MSI Cyborg 15 is slightly above average, we would not however recommend this for professional editing work, but you should have great visuals while gaming.

THERMALS AND BATTERY

Gaming laptops don't usually come with long battery lives, and the same applies to the MSI Cyborg 15. During our PC Mark 10 gaming battery benchmark, the Cyborg 15 lasted 65 minutes, so a little over an hour.

Coming to the thermals; the MSI Cyborg can run pretty hot. During our stress test, we recorded CPU temps of 94 degrees Celsius. Surface temps can also get pretty high, especially the centre of the laptop, which hit around 43 degrees during our gaming stress test. WASD was on the slightly warmer side at 35 degrees, while the palm and touchpad stayed cool at around 26 degrees.

Regardless, you'll want to keep this laptop on a desk when you're gaming, and not on your lap. Note that we do all of our thermal testing in an air conditioned environment, so the laptop could run even hotter in non-AC environments.

GAMING PERFORMANCE

Finally, we come to the performance. We'll start things off with the gaming performance.

The MSI Cyborg 15 features an NVIDIA RTX 4050 Laptop GPU, which in our tests so far has managed to outperform the RTX 3060 Laptop GPU in most real world gaming benchmarks. However, compared to the RTX 4050 in the Acer Predator Helios Neo 16 we recently tested, the 4050 in the Cyborg falls short by a pretty large margin.
