

Realme 11 Pro+

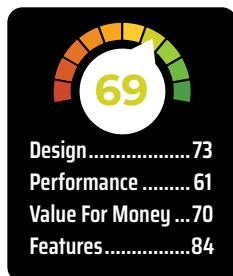

Camera redemption at the cost of experience

Realme's 11 Pro series comes about six months after we saw the predecessor Realme 10 Pro series make it to the markets. The Realme 11 Pro series comes as an attempt from Realme to gain much-wanted redemption in the camera department since the Realme 10 Pro and Realme 10 Pro+ weren't the best camera smartphones in their respective segments. With the Realme 11 Pro series, the brand has now established that the major focus on both the Realme 11 Pro and Realme 11 Pro+ is camera. Let's take a look at what has improved as compared to the previous generation.

DESIGN

The design on the Realme 11 Pro+ is probably my favourite thing about this device. The smartphone has been designed in collaboration with former Gucci and current Bulgari designer Matteo Menotto and the results have paid off. The Realme 11 Pro+ comes with a nice curved display design, with a very beautiful back panel made with vegan leather. We get a huge circular camera module that holds the triple rear camera, and there is a leather back panel, which is divided into two by a fabric stitched strip that runs down the middle of the camera module.

The back panel looks quite stunning, in my opinion. The leather feel of the curved back panel with the stitching patterns looks really premium and gives a very luxurious in-hand feel. The size is also pretty decent. The Realme 11 Pro+ isn't very big and single-handed usage is also pretty easy and convenient. While it has a fairly large 6.7-inch display, the end-to-end screen with the curved implementation keeps the size in check quite nicely. The Realme 11 Pro+ is also quite

lightweight, weighing just 189 grams. Good.

Up front also, we get a very premium-looking curved display which nicely blends into the frame of the smartphone. Complemented with the back panel also flowing nicely into the frame, even the smart-

phone's side profile is very good looking. Overall, I think Realme has got things right this time around, at least in the design department. Realme has also been the brand that experiments a lot with its designs. At times, these designs don't really pay-off, but with the Realme 11 Pro series, the brand has probably made the best looking smartphone in this segment.

DISPLAY

Coming to the display, this is another one of my favourite things about the smartphone. The Realme 11 Pro+ display

is a nice 6.7-inch curved AMOLED panel with an FHD+ resolution and 120Hz refresh rate. The 10-bit display on the Realme 11 Pro+ also supports HDR10+, which makes watching content on this device a very good experience. Further, the display has a brightness of 823 nits. We put this to the test using a Lux Meter, and the smartphone showed a pretty decent max luminance of 823 nits, with the minimum luminance being 3 nits on a plain white screen. This is a very good range. Of course, this is an AMOLED display, so the brightness is good and it feels more vibrant, given the sharper details and a wider range of colours. I also put the Realme 11 Pro+ through the Calman test, and the smartphone showed very good colour accuracy. In sRGB Colour Match, the Realme 11 Pro+ showed an astonishing average DeltaE of 1.6 in sRGB colour checker analysis. This is one of the best numbers we have ever seen in the sRGB colour checker analysis in this segment. In fact, the Realme 11 Pro+ showed a maximum DeltaE of 3.8, which is pretty decent for being an average DeltaE for this kind of device, let alone be the maximum-possible error in terms of accuracy. The colour checker analysis showed that Realme 11 Pro+'s display mostly misses out in shades of orange or brown, or even red slightly.

The results were equally good in the DCI-P3 colour checker analysis. Here, the Realme 11 Pro+ showed an average DeltaE of 2.2, which means that the colour accuracy on this display is very good.

I also ran a Grayscale test on the Realme 11 Pro+. Here also, the Realme 11 Pro+ display showed very good RGB balance. In both sRGB and DCI-P3 colour profiles, the green value was marginally higher than the blue and red, but apart from that, the results were pretty much perfect. So overall, this is a pretty kickass display. From the colour accuracy, to the responsiveness, to even the brightness, this is pretty much one of the best displays in this segment.

CAMERA

Coming to the main part, the camera. The images from the primary shooter
