

rible keys. and With improved key travel and a design that minimises the risk of debris getting trapped. It's a relief for anyone who values a reliable and hassle-free typing experience.

Performance and Benchmarks

What is even better on this machine is the performance, I have the base model here with 8GB RAM and 256GB SSD and even then this feels very snappy. But what's more impressive is its price-to-performance ratio. Let me explain! The M2 chip in the 13-inch MacBook is available in two variants -

- One with an 8-core CPU and an 8-core GPU for Rs. 1.14 lakh
- Another one with an 8-core CPU and a 10-core GPU for Rs 1.44 lakh

And the M2 chip in the 15-inch MacBook Air only has 1 variant, the more powerful one! And it only costs Rs 1.34 lakh. Now, provided that the faster 13-INCH M2 MacBook comes with 512GB SSD by default, but for someone who wants a bigger screen and all the benefits that come with a bigger chassis, the 15-inch is the one to go for. Besides, you can always attach an external SSD to your Mac and resolve the low storage issue. And the supposedly slower 256GB SSD does seem to be lagging behind on paper but in real-world usage, it's barely noticeable.

In the benchmarks, you can see the multicore performance diff. between the 13-inch and the 15-inch base model Macbooks. But the single core score is almost the same. So tasks like opening

or closing apps, or editing documents, and the general process of scouring the web is just identical across two devices.

So what I am trying to say is that whether you're editing videos, browsing the web, or doing a lot of stuff at once, the MacBook Air M2 will just glide through all that. And I know that no one would play games on a Macbook but I went ahead and did so anyway. Specifically, I played the DOTA 2 and the Metro Exodus and they both performed really well for a thin and light MacBook with no fans! And after playing these games I realised that these are capable machines and only need developer support on it. I mean Resident Evil Village, which is optimised for Apple Silicon, runs very well on the M2 MacBook Air and Apple also announced a game porting toolkit that'd give developers an easy way to bring more of their games to Macbooks. So Apple may not have been all that serious about gaming in the past but things are starting to change.

Goes on and on!

What's also changed is the battery life. The 15-inch M2 Air averages around 14 and a half hours, falling right in between its smaller siblings—the MacBook Air 13 and the MacBook Pro 13. I mean you can easily survive a full workday on one charge. The MacBook Pro 13 with the M2 chip has an impressive battery life of 16 hours and 15 minutes, outperforming both the MacBook 15 with M2 chip at 12 hours and 28 minutes and the MacBook 13 with the M2 chip at 14 hours and 40 minutes.

Winding up

So, here's the bottom line—Apple has listened to its users and delivered a MacBook Air that ticks all the right boxes. It is not changing the world in any way but it is doing what a laptop is supposed to do, here's the important part, and then some more. Like when I talked about gaming, Apple is slowly and surely getting there, So This was the 15-inch MacBook Air M2 and I think here's why this is the one you should get. **👍**
