

and most of the folks found the earbuds to be well fitting. The fit is not like the typical IEM fit, but for being what it is, it is excellent, especially for the price of ₹1,990.

Performance

In terms of performance, the Moondrop CHU performs as well as you'd expect a Chi-Fi IEM to perform. As you can see from our sound signature graph, the earbuds have a subtle U-shaped sound signature. There is a boost to the low frequencies, with the highs also seeing a significant boost to make up for the introduction of the thump of the lower frequencies. The mids come pretty close to our benchmark reading of Pink Noise. The brand heavily advertises the dynamic drivers in these earbuds, and it shows why!

Now, what does it mean when you are listening to these earbuds? Well, you get a well-rounded frequency response. This means that you will be able to

enjoy multiple different genres of music without having to play around with EQ settings a lot. If you are a fan of rock/metal music, then you might be able to catch some detail loss with the sounds of some of the very high-pitched instruments, but you should be fine for the most part. The boost in the higher frequencies is not enough to introduce sibilance, which means that if you are planning to wear these for longer listening sessions, then you will get through them without any discomfort, at least from the sound perspective.

Coming to the performance of the microphone on these earbuds. Well, I have one thing to say - The performance is way beyond my expectations. In some of the most challenging situations where I have seen TWS earbuds that are priced two times higher than these struggle, these earbuds shined through. If you are standing in the middle of a crowded traffic signal and trying out these earbuds, then you will

have a thing or two to complain about. Otherwise, I hardly think you will find any negatives when using the mic of these earbuds.

What's the final word?

Well, if you are looking for a pair of Chi-Fi IEMs around the ₹2,000 mark, then you should definitely have the Moondrop CHU at the top of your list. I would say give it a try before getting them for yourself to ensure that you are getting the best fit. But if you decide to go in blind, then I don't think it would be a problem to get the right fit after going through some of the different ear tips that are included with these earbuds. As for the sound, they sound great for the price they are retailing at. You can not obviously expect professional-grade audio from a pair of TWS that costs this much. So, if you set your expectations straight, then I can confidently say, tMoondrop CHU will live up to them! **d**

SIGMA

A Art

14mm F1.4 DG DN NEW

*Sony E-Mount & L-Mount

- The world's widest F1.4 single focal length lens was born from the passion of an engineer who wanted to capture the widest, brightest, highest resolution, and most comfortable astrophotography.
- Equipped with a wealth of functions to support astrophotography
- In addition to the dust- and splash-proof body, the front surface of the lens is coated with a water-repellent and anti-fouling coating for peace of mind even in harsh outdoor environments.
