

OPPO Reno10 Pro

Appealing design, impressive cameras, but heavy on the pocket

Oppo's Reno series of smartphones is usually the company's high-end offering for every year. Smartphones in the Oppo Reno series have, over the past couple of years, been centered towards the premium look and feel and the cameras. This year, with the Oppo Reno 10 series, the BBK Electronics-owned brand has continued the trend of offering a premium look and feel with a certain focus on the cameras.

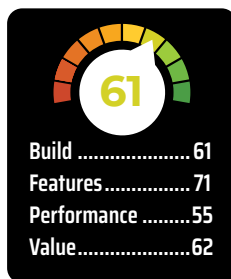

The Oppo Reno 10 Pro being the middle child. The smartphone was launched in India at a price of ₹39,999 onwards on July 10, and after using the smartphone for a good couple of weeks, I found this to be a bit overpriced in terms of what you get against what you pay. This, after using the smartphone for my daily average tasks, gaming, using the camera extensively, and doing other stuff over two weeks. In my review, I will talk about all aspects of the smartphone, which will answer the question as to why the Oppo Reno 10 Pro is overpriced in my opinion.

DESIGN

Starting with the design. This is where the Oppo Reno 10 Pro 5G justifies the steep price tag the most. The smartphone looks stunning. We get a nice curved OLED display up front with the hole-punch camera cutout. At the back, we get a nice curved glass back with an oval-shaped camera module. As usual, the speaker grille and USB type-C port are on the bottom of the frame, with the volume rockers and power button on the right side of the frame.

The in-hand feel of the Oppo Reno 10 Pro, with the glass back and the curved display is very premium, and

₹39,999

you feel that from the moment you first hold the smartphone. Only the oval-shaped camera module is where we got mixed reactions, where some people liked it, and some didn't. I personally like it since it gives the Oppo Reno 10 devices

their own distinct look. We got the Glossy Purple colour for our review, which also looks quite pretty.

DISPLAY

The display of the Oppo Reno 10 Pro is also very good. The smartphone comes with a nice 6.7-inch FHD+ curved OLED display with a 120Hz refresh rate. The display resolution is 2412 x 1080p, which comes around to a pixel density of 394ppi, meaning the display is sharp enough for all kinds of users and you won't feel any lack of detail or rough edges on this display.

Coming to colour accuracy, here also the Oppo Reno 10 Pro showed very good

results, but wasn't the best we have seen in this segment. In the colour checker analysis using the Calman SpectraCal tool, the Oppo Reno 10 Pro showed an average DeltaE of 2.0 in the sRGB colour profile. This means that the colours you see on the smartphone are very close to the actual colours, and the margin of error is very low.

In the greyscale test, the Oppo Reno 10 Pro showed super impressive colours. The smartphone showed very consistent results across the board, with a very even RGB balance. There was no colour that was overflowing or overpowering any other, giving us one of the most impressive results in the sRGB colour profile.

Coming to brightness, the Oppo Reno 10 Pro has a claimed peak brightness of 800 nits under the sun and up to 950 nits for HDR photos and HDR10+ videos. We put this to test using a Lux Meter, and the smartphone showed a maximum brightness of 934 nits on a plain white screen, which is brilliant, since it is exactly around the numbers claimed by the company.

Furthermore, the 120Hz refresh rate makes the display very responsive and super smooth. Scrolling through menus and apps is butter, given the 120Hz refresh rate. We don't get LTPO technology with this display, but that is probably nitpicking at this point, since everything else on this display is very good.

PERFORMANCE

Now the performance is where I think the Oppo Reno 10 Pro doesn't justify its value at all. The smartphone is powered by a Qualcomm Snapdragon 778G chipset, which is more than two years old at this point. Now, this wouldn't have been too bad since the Snapdragon 778G is a very nice and balanced chip, but there are devices in this range like the OnePlus 11R and the iQOO Neo 7 Pro that offer a proper flagship chip (Snapdragon 8+ Gen 1) from less than a year ago.

As expected, the performance numbers look miniscule as compared
