

to some of the competing devices. On AnTuTu, for example, the Oppo Reno 10 Pro put out a score of 584215 points, which is almost half of what similarly-priced OnePlus 11R gave us and less than half of what the ₹5,000 cheaper iQOO Neo 7 Pro puts out. In fact, on AnTuTu, the smartphone's numbers were closer to the budget smartphones of today as compared to its competitors in the market. Disappointing.

In other CPU-based benchmarks like Geekbench and PCMark also, the Oppo Reno 10 Pro gives a rather disappointing result, making the smartphone's performance numbers appear miniscule as compared to competition.

In GPU-based tests also, the Oppo Reno 10 Pro didn't perform well. In 3DMark Wildlife Extreme, the smartphone scored lower than most devices, but came ahead of the Google Pixel 7a. In GFXBench, the device struggled to keep up with the competition across the tests we ran on the device.

BATTERY

The battery on the Oppo Reno 10 Pro is good. The smartphone uses many techniques to offer a good battery backup like Oppo's Battery Health Engine or the SuperVOOC S power management chip that facilitates an enhanced discharge efficiency, leading to better standby times and safer charging.

The battery backup, however, is just decent. We get a 4,600mAh battery with support for 80W SuperVOOC charging. The Oppo Reno 10 Pro doesn't drain battery as such. The smartphone, in fact, offered a very good battery consumption while playing games or watching content or even during GPS navigation. For example, playing Call of Duty: Mobile on the smartphone for 15 minutes drained only 3 percent of the battery. Watching HDR content on YouTube for 30 minutes, drained only 4 percent. Finally, GPS navigation for 1 hour straight drained only 8 percent of the smartphone's battery, which is great.

In our video loop test, however, due to the smaller battery unit, the Oppo Reno 10 Pro only lasted 742 minutes.

Now, while this number sounds a bit less if we pit it against some other smartphones in this segment, but 742 minutes make for 12 hours and 22 minutes, which is pretty decent.

While the battery backup may not be the best, this is probably the fastest 80W charging I have experienced on any smartphone. The Oppo Reno 10 Pro charged from 0 percent to 100 percent in just 28 minutes! This is not only super fast for 80W fast charging, but even beats some 100W fast charging smartphones (mainly because of the smaller battery size)! Superb stuff.

CAMERA

Now this is where the Oppo Reno 10 Pro tries best to justify its price-tag. The smartphone has a very good triple rear camera setup that consists of a 50-megapixel primary shooter, a 32-megapixel telephoto lens, and an 8-megapixel ultra wide angle shooter.

The camera performance out of the primary shooter is decent, just the images don't seem very sharp and detailed in the normal photo mode. The smartphone takes nice photos with a very good dynamic range, even in low light or in confusing lighting conditions. 90 percent of the time, the Oppo Reno 10 Pro's camera does a good job in getting things right. The shadows, the colours, and the detail is spot-on most of the times. However, at times, I found the photos to lack a certain level of sharpness and detail, but that was a problem I majorly faced in low light conditions.

The 32MP telephoto lens is my favourite. Photos from the telephoto lens also offer great quality. The telephoto lens facilitates up to 5X optical zoom and in proper light, the images in 5X are also sharp and don't lose any details. The colours are well represented in images taken from the telephoto lens. Here also, the 5X zoom doesn't seem as impressive in low light.

Given the presence of a telephoto camera, the portraits on the Oppo Reno 10 Pro weren't as good as I expected

them to be. The edge detection isn't the best out there and at times, the focus on the subjects is a bit soft.

It is the ultra-wide angle shooter which is disappointing. The images from the ultra-wide aren't very good. They lack sharpness, the colours are all dull and washed out, and there is a weird blur on the extreme corners of all wide-angle images.

VERDICT

So that was the Oppo Reno 10 Pro. The smartphone is priced high, starting at ₹39,999 in India. In some cases, the smartphone does justify the value. We get a nice premium in-hand feel with a striking design and colour. The display is super accurate and responsive, offering an immersive experience every time users set their eyes on it, and the camera performance is also good, just the portraits and wide-angle lens can use a bit fine-tuning.

It is the performance where the Oppo Reno 10 Pro lags way behind competition. The smartphone runs on a more than two years-old mid-range chipset from Qualcomm and the performance numbers show how far behind the smartphone is.

So the answer is clear, if you are a power user who wants the best performance and battery experience from your device, there are better options available at a lower price. But if you are someone who wants a premium look and feel with a very good camera and display, the Oppo Reno 10 Pro may justify the steep price-tag for you.
