

realme Buds Air 5 Pro

A bass lover's dream with a well-rounded feature set

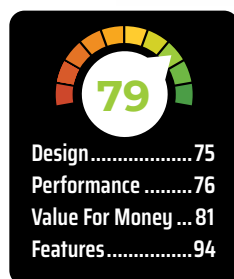

realme has added another pair of TWS earbuds to their lineup. The realme Buds Air 5 Pro. When I was first introduced to the Buds Air 5 Pro, I expected them to be in the same league, but without giving away much, I would like to say that realme is holding its ground well. Have a look at my full review of the realme Buds Air 5 Pro –

BUILD AND DESIGN

In terms of design and build, at first glance, the realme Buds Air 5 Pro is indistinguishable from its predecessors. But once you pop the lid open, you start to notice the differences between the two. Let's start with the design of the earbuds. realme, with the Air 5 Pro, has gone with a fairly monochromatic design aesthetic.

Previously, we have seen the brand go with a dual-tone design, which in my opinion, looks slightly better and helps the product stand out. But the minimalist in me, loved the way Realme played with different shades of white on the earbuds, especially the stem.

The buds fit well in my ear, and the stem design, which I am a fan of, ensured that the buds stayed in place, even when I was out on my daily morning runs or on my way to the office on the train. Talking about taking them out in the open. These earbuds are IPX5 rated so exposing them to a bit of splashes should not be an issue. They are lightweight, and wearing them for long periods of time is not an issue at all! realme has included three different sizes of silicone ear tips, and that should be enough for most of you planning to take the plunge.

As for the case, it retains most of the aesthetics of the Buds Air 3 case, with the oval bean-shaped design with a slight indent at the top, housing the branding, filled up with a transparent layer. The case has a glossy finish, which means that it very easily picks up scratches and scuffs, so I would recommend that you use the earbuds with care, if you want to retain their looks. The hinge is sturdy and the magnets do well to hold the lid in place.

On the side of the case, you get a clicky silver-coloured button, which can be used to make the earbuds enter pairing mode. I love when brands add this on the case, because for someone, who switches between devices a LOT, this button can come in clutch when you are troubleshooting connectivity issues of any kind.

Considering that these earbuds will be retailing around the ₹5,000 mark, I would have expected realme to add in a metallic

hinge. But, that is just me asking for more, and the corners they cut here, they made up for in the performance department. Or so it seems. We will talk about it later. For now, let's look at the features of the Realme Buds Air 5 Pro.

FEATURES

In terms of the features, realme has packed in a decent number of them in the realme Buds Air 5 Pro. First on the list are the two most interesting ones of the lot for me – 360-degree spatial audio, and Personalized Audio Algorithm. With the Buds Air 5 Pro, I was surprised to see how well they worked!

Add to the mix, the support for LDAC audio CODEC and Hi-Res Audio Certification, and you have a recipe for success in India. Why I say in India? You shall find that out soon.

Then there is the realme Link app. The app has undergone a lot of development and has become even better. The UI and UX of the app, coupled with the features that it brings to the table, makes it completely worth it to install the app! And I would recommend you do that, the first thing after getting your hands on the earbuds.

One of the other highlights for me on these earbuds is the wearing detection. I have never seen any earbud come close to the AirPods in terms of responsiveness to wearing detection. But with these, I was happily surprised and proven wrong. The wear detection on these earbuds worked like a charm during my time of use.

The touch controls on these earbuds are well-implemented. However, during my time of use, I often ended up missing the touch-sensitive area because of the rounded stem. I believe with the next iteration of the earbuds, a rounded stem with an indented bottom part, which has pinch controls, would be the ideal thing for the brand to do. But, there is not much to complain about the current setup. It works well, but is not the best in my opinion.

The realme Buds Air 5 Pro pack support for 40 ms low latency mode, Google Fast Pair, Dual-device Connection 2.0,
