

# Cooking more efficiently than before

MAKES YOU WONDER WHAT'S COOKING...

A

2015 survey conducted across 22 countries, including the likes of Russia, China, USA, UK, Turkey, France and Australia, among others, concluded that India topped the world in terms of maximum number of hours spent in cooking on an average. As per the study, while Americans spent near 5.3 hours in their kitchens per week, Indians slogged for more than 13 hours.

“Evidently, we spend at least double the time in kitchens as compared to Americans. If you take into account those living in suburban and rural parts of India, who might not be a sample for this survey, it might spike up to around 21 hours a week, i.e. 3 hours per day,” said Sanandan Sudhir, Founder & CEO of On2Cook. His creation slashes the cooking time of most Indian food in a big way, ensuring that one does not have to spend hours before the stove.

“Our own experience in Gujarat and Maharashtra suggests that in restaurants and cloud kitchens, On2Cook helps cook meals in one-third the usual time. This ensures a quicker time to table, say 10 minutes instead of 25, simultaneously cutting down energy consumption by 50-percent,” according to Sudhir.

Sanandan Sudhir hails from National Institute of Design,

Ahmedabad, so it's no surprise he thought of creating On2Cook – a cooking product that met his requirements. After shifting to Bengaluru to join GE, he faced a lot of challenges in cooking food at home, so he thought of combining elements of a stove and microwave into one single product. “This is how originated the idea of On2Cook, a first-of-its-kind cooking device that holds the potential to revolutionise the way we cook, both in domestic as well as commercial kitchens,” he said.

Sanandan Sudhir, Founder & CEO, On2Cook

It's not just about convenience of cooking food with the On2Cook, but also the energy efficiency that's causing a disruption in the industry, according to Sudhir.

“Gas cooking has an efficiency of 50 percent, whereas On2Cook cooking boasts a 90 percent efficiency. Considering the costs and efficiencies, let's delve into the economics of cooking chicken. When cooked on gas (taking approximately 45 minutes), the cost of making 1 kg of chicken amounts to ₹35. However, with On2Cook, the same quantity of chicken costs just ₹3.5. And let's not forget the superior quality of the cooked chicken using On2Cook. By cooking without adding water, we retain valuable water-soluble vitamins and minerals, as well as inherent moisture,” claimed Sudhir. The result? Tender, flavorful chicken with an extraordinary taste, he said.

And the claims don't stop there. While the aforementioned facts pretty much sum up the uniqueness of On2Cook, it is pertinent to mention here that this combination cooking device may end up revolutionising modern kitchens, especially in restaurants and cloud kitchen facilities. “It saves over 50% energy, cuts down cooking time by nearly 70% and preserves texture, colour as well as consistency. Furthermore, it replaces many of your appliances/utensils, so you have more space and fewer things to manage.
