

For commercial kitchens, On2Cook is the only solution for minimising lead time to retain opportunities that would have been lost with traditional methodology,” according to Sudhir.

In addition to the cost of cooking and quality of food, customer churn is a major concern for restaurants. It results in owners refraining from expansion and franchises underperforming due to factors like inconsistency of food served and non-adherence to SOPs, especially in cloud kitchen models. “There is also too much dependence on chefs, and adding to it are high infrastructure costs, in terms of chimneys, equipment, appliances and wastage of oil as well as food. As for the domestic kitchens, some of the major issues are loss of vitamin, nutrients, texture and colour in cooked food, and consumption of too much time in the process. There are many who fail to devote requisite time to their families as well as their own creative self due to paucity of time compelled by cooking. On2Cook is a one-stop solution to all the above-mentioned issues, both for domestic as well as commercial kitchens. While fastening the cooking time rapidly, it ensures that all water soluble and other nutrients are intact in the cooked food,” said Sudhir, who intends to establish a network across key cities in India for distribution and services of the device over the next 6 months, with a laser focus on providing

B2B services. By January 2024, he plans to expand the network into the B2C space, allowing families to save more than 2 hours in everyday cooking.

In terms of use of technology to enhance the cooking experience with On2Cook, Sudhir highlighted an app-based user interface that would allow any user with any level of cooking competency to cook like a professional using the device.

“We have investors who have also invested in a POS company called pet-pooja.com. This collaboration allows us to work towards a seamless integration with POS device and software companies, creating a functional ecosystem similar to that of McDonald’s. Our goal is to empower QRS or small restaurants/cloud kitchens to achieve the same level

of efficiency in their ordering, cooking, and delivery systems as the fast-food giants,” highlighted Sudhir.

Here their app plays a crucial role in this transformation, seamlessly integrating with the product. As a restaurant or cloud kitchen owner, you can create and customise recipes, which are then sent to the devices for efficient cooking. With minimal chef-level skills required, the AI-assisted device understands the nuances of time and temperature adjustments based on factors like ambient temperature, food quantity, and unexpected delays.

“For instance, if a phone call interrupts the cooking process, the device will patiently wait, maintaining the correct temperature. When you return, you can pick up where you left off, with the device automatically adjusting the time and temperature to ensure a perfectly cooked meal. With this comprehensive solution, restaurants and cloud kitchens gain scalability, while individuals with limited cooking experience can effortlessly create delicious meals,” he said.

Throughout the development journey of On2Cook, Suhir mentioned how the company has filed multiple patents and obtained 10 granted patents across various geographies. “This iterative process spans across 14 generations, and to ensure functionality of On2Cook, we have established an ecosystem in Thailand, Malaysia, China, Hong Kong and India for managing the necessary technologies and manufacturing all the required parts,” he mentioned.

On the verge of enhancing the cooking efficiency of kitchens around India and the world, Sudhir explained the guiding principles of his mission with On2Cook. “The developed world has achieved its status by innovating solutions to solve pressing problems and leveraging skilled businesses to distribute these products across continents and numerous countries. Now, it’s our moment to shine. Our recipe for growth entails developing world-class solutions that address critical daily issues, and swiftly scaling them globally before competitors catch on,” he concluded. ■
