

Harmonising Sustainability and Sound

WHEN SUSTAINABILITY MEETS ACOUSTICS - IN CONVERSATION WITH RIYA MULAY, THE CREATOR OF BAMBOO HEADPHONES

Satvik Pandey | satvik@digit.in

From admiring intricate crafts to conceiving groundbreaking solutions, this journey gave rise to bamboo headphones – an ingenious fusion of sustainable materials and cutting-edge audio technology. Driven by curiosity and a passion for sustainability, the Riya Mulay explored bamboo's potential beyond tradition. The result? Bamboo's rapid growth and eco-friendliness aligned harmoniously with high sound quality. A pivotal collaboration with a professor led to the selection of appropriate drivers, marrying craftsmanship with technology.

Bamboo's acoustic virtues amplify its eco-friendliness. This budding innovation, supported by university grants, envisions headphones not only resonating with sound but also a greener planet. A testament to India's evolving manufacturing landscape, this project aligns with the "Make in India" initiative.

This narrative echoes lessons for aspiring entrepreneurs. It exemplifies uncharted exploration, merging tradition with technology and leveraging academia for entrepreneurial endeavours. As this young designer's journey unfolds, it underscores the potency of dreams nurtured by education and kindled by national entrepreneurship initiatives. Ultimately, it's about more than headphones – it's about envisioning a resonant future that harmonises innovation and sustainability.

So, we spoke with Riya Mulay to dig deep into the process of the development of this unique audio product that definitely holds the potential to grow into something bigger than it is –

Q What gave you the idea of creating bamboo headphones? Did you enlist help for the tuning of the drivers or were they sourced?

A While walking down the lanes of the old city in Pune, I stumbled upon a vibrant community of bamboo artisans. Looking at their intricate handicrafts and skilled craftsmanship, I thought of how the material and its processes could be further explored for other work beyond mere handicrafts. This prompted me to conduct research on the use of bamboo in India, especially other products. As I delved deeper into research and brainstormed ideas, the concept of bamboo headphones took shape in my mind. As a design student with limited knowledge of electronic components, I sought guidance from my professor, who helped me find suitable drivers for the headphones.

Q How does using bamboo in headphones lend itself to being more sustainable than the materials currently used?

A Sustainable products are better for the environment, economy and society.

Bamboo proves to be beneficial in multiple stages of the life cycle of the product, from raw material extraction to its disposal. Bamboo is a fast-growing grass, as the cut bamboo shoots grow back rapidly; reducing the environmental impact. Also, local manufacturing and sourcing of raw materials have proven to provide a stream of income to many people involved in the chain, some of whom are struggling with making a decent living. After the end of the life of the product, unlike its counterparts, bamboo headphones will not stay in landfills for years to come. Emissions during the making of the headphones are also comparatively less than plastic.
