

performance across these channels, with offline platforms serving as a preferred choice when customers desire a hands-on experience, particularly for premium products like our flagship Yoga Tab and the recently launched Tab P11. However, it is important to note that the purchase cycle spans both online and offline channels, catering to the preferences of a diverse audience.

Q What are some of the latest technological developments in Lenovo's tablets? What is the size of the R&D team, and are they present in India?

A The R&D team at Lenovo is a global expert team. This team is responsible for ensuring that our tablet lineup stays up to date with the latest trends and consumer demands. Speaking of trends, one notable shift in consumer buying behaviour is a preference for larger screen sizes. Recognising this, we have included larger displays in our new product portfolio. Additionally, consumers are increasingly interested in purchasing accessories such as keyboards, styluses, and tablets with pens, as these enhance the overall user experience. We have taken these use cases into account and have incorporated them into our latest offerings. Our focus is on providing a comprehensive portfolio rather than just a standalone screen.

Q Lenovo is committed to local tablet manufacturing in India. Does the company manufacture all the components in India or is it imported and then assembled here?

A Lenovo is strongly committed to local tablet manufacturing in India. Our current tablet production line already incorporates a significant portion of manufacturing in India, and we are actively working towards expanding this further. This is in line with the increasing demands of the Indian market, which is not only driven by education but also by the growing need for automation in both commercial and consumer sectors. Additionally, we are grateful for the government's support in this endeavour, as evidenced by the

recent announcement of the PLI policy. This policy further reinforces our belief and commitment to manufacturing devices locally in India.

Q What are some of the challenges faced when manufacturing tablets in India?

A From an Indian perspective, manufacturing tablets and other products faced challenges in the past. Sourcing the right partners and setting up production facilities were particularly challenging during the initial stages. However, with the government's support and the implementation of favorable policies like the PLI, the manufacturing process has improved. Over the years, the industry has gained experience and become more streamlined. These ongoing efforts have positioned India as a competitive hub for tablet manufacturing.

Q One problem with tablets is that they've never really had fantastic cameras like we get to see on smartphones. Since WFH is still somewhat prevalent, is this something that will improve and what efforts is Lenovo taking to implement better tablet cameras?

A With the persistent rise of remote work and the increasing demand for tablets, the need for better cameras has become apparent. Lenovo recognises this and is taking steps to constantly improve product capabilities. In the past, tablet cameras typically offered a modest 5-megapixel resolution for the rear camera and started with an 8-megapixel front camera. However, Lenovo's new product range now boasts a 13-megapixel camera, showcasing a clear shift toward enhanced camera performance. It's important to understand that while cameras are an important feature, the primary purpose of tablets goes beyond photography. Also, when considering the hierarchy of consumer priorities, camera functionality ranks lower compared to other essential tablet functionalities. Tablets serve as versatile devices for content consumption, content creation, and productivity.

In line with consumer needs and our own focus, our emphasis has been on providing tablets with high-performance processors and delivering a seamless user experience. Additionally, features like effortless text conversion and seamless stylus input have become increasingly relevant in meeting customer requirements. As Lenovo continues to innovate and develop its product portfolio, including tablets, improvements in camera technology will undoubtedly be part of the evolution. However, the greatest emphasis will remain on delivering a superior overall experience, meeting the diverse needs of consumers in the realm of infotainment and productivity.

Q In your research, how important is gaming for users on tablets? What steps are taken to ensure a smooth and hitch-free gaming experience on Lenovo tablets?

A Mobile Gaming is an evolving segment with a growing demand for compact handheld gaming tablets. To cater to this demand, Lenovo offers a gaming-specific tablet called the Legion Tab Y700, which has been well-received in global markets. In India too, consumers are increasingly seeking a seamless and immersive gaming experience on their tablets. Although the market is still evolving, we recognize the importance of delivering a strikingly productive gaming experience to our customers. Legion Y700 boasts of a Snapdragon 8+ gen1 processor, 144Hz display and 3 cameras packed into a powerful 8.8" device.

At Lenovo, we are taking various steps to ensure a smooth and hitch-free gaming experience on our tablets. This includes leveraging cutting-edge technologies and hardware components that enhance performance, graphics, and responsiveness. **■**
