

tures 100% of the devices in India and is even exporting out of India to multiple countries including North America. Domestic manufacturing also gives us the capability to have a faster time to market and design products specifically addressing the needs of the Indian consumer. Finally, we are increasing our investments in marketing to create more touchpoints for the consumers and expanding our footprint across online, retail, D2C, and O2O channels.

Q How big a role will the launch of Moto Razr 40 and 40 Ultra play in building the “premium” and cutting-edge image of Motorola in India? Also, how has the response been to the Moto Razr series so far in India? Can we expect a folding Moto in the near future?

A Razr holds an iconic status, the Razr V3 achieved unparalleled success as the highest-selling phone of all time, boasting a remarkable sales figure exceeding 100 million units. Similarly, our recent launches, the Motorola Razr40 and the Razr40 ultra are iconic devices that provide a smartphone experience at the intersection of style-driven self-expression and cutting-edge technology. The response to both the devices has been exceptional owing to its distinctive features like the Motorola razr40 ultra's 3.6" external display, which is the world's largest, fastest, and highest-resolution resolution on any flip phone with a refresh rate of 144Hz. Additionally, redesigned teardrop hinge makes both the Razr phones one of the world's slimmest and gapless foldable smartphones when folded.

Motorola razr40 Ultra has been the highest-selling smartphone during the Amazon Prime Days Sale in 2023 in its price segment and the razr40 series emerged as the biggest-ever flip phone launch on Amazon, with Motorola Razr40 and Razr40 Ultra together achieving the highest number of sales for a flip phone during Amazon Prime Days Sale 2023. The Flip phones have also been generating impressive sales across avenues such as D2C and retail.

While we can't comment on our future portfolio, we are already leaders in the foldable ecosystem through our Razr family of devices and are committed to investing in the technology.

Q Staying on the Moto Razr series, the biggest concern over flip/fold phones has been the longevity of the folding display and the hinge mechanism. Has Motorola done anything special to ensure the flip mechanism and the flexible OLED display stand the test of time?

A Motorola has introduced a redesigned teardrop hinge with this new razr40 family of phones, featuring the industry's first dual-axis tracking that minimizes the size of the system. Compared to other foldable in the market, the razr40 ultra is the thinnest when flipped closed. Moreover, the integration of this hinge system with Ultra Thin Glass makes the foldable nearly creaseless when the display unfolds, resulting in a seamless look and smooth tactile experience. These razr phones underwent rigorous cycle endurance testing, including flip testing. So together with this redesigned teardrop hinge and advanced Ultra-Thin Glass, razr40 phones are built to withstand 400,000 folds - that is twice more than the previous generation.

Q Motorola is known for innovations on the design front, we have seen some interesting innovations in the past with the Moto Mods and the Moto Z and Moto X line-up of phones which were raved about for their design innovations. Can we expect Motorola to bring that magic back?

A Motorola aims to enrich people's lives through meaningful innovations. We pioneered the mobile communications industry in 1973 and have been responsible for innovating some of the most iconic, stylish devices of all time. Our pioneering spirit and commitment to finding new ways to solve consumer problems continue to inspire us, as we focus on meaningful innovation to

create differentiation. Motorola and Pantone are in an exciting partnership to bring revolutionary devices in colors that tell each person's unique story. Through this partnership, we produced the world's first phone in Pantone's Color of the Year 2023- Viva Magenta, the Motorola Edge 30 Fusion. In our globally exclusive partnership with Pantone in the smartphone category, we have seen how technology and color can intertwine to provide a vessel of expression, fostering creativity and unlocking immersive experiences along the way. We are co-creating colors with Pantone across multiple devices, not just in the premium segment, but extending into mass segments as well. We are also experimenting with materials and finishes, such as the premium vegan leather designs of our phones.

With most of our launches, we bring in disruptive features that consumers need at competitive prices. Markedly, we are the industry's first to launch the flip form factor with the Razr series. This is a family of devices that spans over four generations, and Motorola plans to continue investing in it. We also introduced the world's thinnest 5G smartphone and the world's thinnest IP68-rated 5G smartphone, with the launch of the Motorola Edge 40. Notably, the world's first 5G call was also made via a Motorola phone. Additionally, at the Lenovo Tech World'22, Motorola introduced a new rollable smartphone concept. We are investing in flexible OLED, or pOLED, screens to deliver an optimal balance of content and comfort. The Rollable concept embodies this idea with a screen that adjusts to three distinct states: extended, compact, and peek, with a simple press of a button. So the answer is a vehement yes. When it comes to design, form factors, and innovations in the Smartphone category, Motorola will continue to create magic.
