India surges to 47th global ranking in median download speeds

Ever since the fifth-generation (5G) internet service rolled out in India, India's global ranking of median downloads has been increasing. The credit for this can be

given to the arrival of Airtel and Jio 5G across various Indian states. Now, as per the recent tests by Ookla, India ranks 47th globally ranking in median download speeds, as of August 2023.

This is a big leap considering the fact that last year, in September 2022, India held the 119th spot. Let's take a look at what this test reveals. 5G network services were launched commercially in India on 1 October 2022. Within its first year of release itself, India had gained about 50 million 5G users.

The data collected by Ookla points out that median download speeds are increasing, in pan-India. Earlier, this was just 13.87Mbps in September 2022. After 5G was launched for the first time on 1 October 2022, the download speeds saw a 259% increase and it reached up to 50.21Mbps in August 2023. After 5G was rolled out in India, significant issues related to the 4G services were addressed. This also meant an offload of the 4G traffic to 5G and thus in turn, reducing the traffic. Airtel MD & CEO Gopal Vittal even mentioned that they saw a 30% offload as they rolled out 5G service in India.

■ **HOME AUTOMATION**

Google Home's new AI feature will help you easily create custom Routines

Google has introduced a new artificial intelligence (AI) feature "help me script" for Google Home. This new, experimental feature in the script editor will help you to easily create custom Google Home Routines. It will be available later this year in public preview.

"We're introducing 'help me script,' a new, experimental feature in the script editor that makes it easier to create advanced automations, even with little coding experience," the tech giant said in a blogpost on October 2. The new "help me script" feature will give you a starting point for coding more personalised automations. Once you log into your Google Home account on Google Home for web and

open the script editor, you can simply describe what you want to happen in natural language, for example: "If my outdoor camera sees someone after dark, turn on the porch light and make an announcement," or "When the smoke alarm goes off, flash all the lights in the house and announce

an emergency over the speakers." Then, with the help of generative AI, "help me script" will generate the code for you.

You can easily copy, paste and activate that generated code in the script editor. Moreover, you can always modify it later if you need to.
