

Infinix Zero 30 5G

Don't overlook this well-rounded mid-ranger

The Infinix Zero 30 5G is a priced competitively at ₹23,999, the Infinix Zero 30 houses the capable MediaTek Dimensity 8020 processor, up to 12 GB of LPDDR4X RAM, a 108 MP triple camera setup, and 4K at 60 fps video capabilities on the selfie camera. The specifications are appealing on paper, but do they translate well in real-life usage? Let's find out in my detailed review of the Infinix Zero 30 5G.

BUILD AND DESIGN

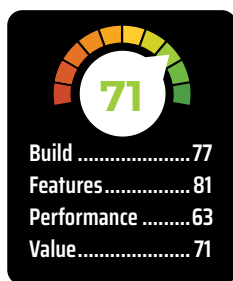

There's very little to critique about the Infinix Zero 30 5G's design. The smart-phone looks super premium for its price. The phone is available in two colourways – Golden Hour and Rome Green – both of which have their own quirks. The Golden Hour variant comes with a glass back with Gorilla Glass 5 protection, but it may be prone to catching fingerprints. The Rome Green variant, which I got for review, features a vegan leather back that feels luxurious to the touch. The phone is slim at only 7.9 mm and very lightweight at 182 g.

The camera island is golden in colour and this design choice may be a bit polarising because some may find it slightly garish. However, I think it works for the sub-₹25K price segment and the phone definitely stands out. There are two circular large camera rings and a smaller one for the 2 MP camera. There's also a circular flash below the smaller camera ring.

The back and front curve into the body which is made of plastic but with a golden-coloured metallic sheen on it. Overall, a massive thumbs up from my end here.

DISPLAY

The Infinix Zero 30 5G sports a premium-looking curved display with minimal

bezels on the sides and slightly thicker bezels on the top and bottom. Scrolling on 144 Hz feels super smooth; and thankfully, the refresh rate applies in apps such as YouTube and Instagram too, which sometimes doesn't happen on budget phones.

The display supports 100 per cent DCI-P3 colour gamut and comes with 2,160 PWM dimming. So, the strain on the eyes is lowered when you're using the phone in darkness. The display is vibrant and pretty colour-accurate. It is also Widevine L1 certified, so you can watch shows in HD on OTT platforms. DRM Info tells me the phone supports HDR10, however, Netflix doesn't detect that, which is a bummer. I hope Infinix can fix this via a software update.

Furthermore, it is rated at 950 nits of peak brightness, and in my tests, I recorded about 915 nits in High Brightness Mode. So, screen legibility in harsh sunlight is not really an issue.

PERFORMANCE

While it definitely is not the fastest-performing phone in the mid-range segment, it gives its competitors a tough run for their money. The phone packs 8 or 12 GB of LPDDR4X RAM, I got the latter for review, and multitasking is exceptionally smooth.

Infinix also boosts this with Virtual RAM of 8 GB on the 8 GB RAM model and 9 GB on the 12 GB RAM model. The phone has 256 GB of UFS 3.1 storage, and I applaud Infinix for offering it across both variants given the size of apps, photos, and videos these days. There's no expandable storage though, which is disappointing.

In benchmarks, the Infinix Zero 30 did a commendable job! It got one of the highest scores in its price segment, only to be beaten by the powerful Redmi K50i that comes with the Dimensity 8100 5 nm SoC. In GeekBench, once again the Infinix Zero 30 was near the top. The OnePlus Nord CE 3 5G beat its Single Core score while the Redmi K50i defeated it in the Multi-Core test. But still, top-level scores! The phone also scored exceedingly well, the best in our tests, in PCMark Work meaning it will be reliable to perform any productivity-related tasks.

As for GPU scores, we ran 3D Mark Wild Life Extreme and the Infinix got a stellar score of 1,253. In GFXBench's tests, the Infinix Zero 30 gave the second-best performance, lagging behind only the Redmi K50i. In real-world gaming, the Infinix Zero 30 rarely faltered. I played Call of Duty: Mobile on High Graphics and Frame Rate settings, and it performed splendidly with no lag or stutter. Asphalt 9 also ran very smoothly on this phone, but the phone does heat up slightly during long sessions.

Neither will your day-to-day tasks such as calling, texting, and browsing social media and the web. It is also very capable of handling heavy-duty tasks such as photo and video editing but slows down slightly when rendering videos. The UI of
